THE LINE
OF
PROPORTION,
Commonly called
GUNTER'S LINE,
Made Easie.

A SECOND PART.

With the addition of other Lines, which may convenient y be put upon a *Two-foot Rule,* and their *USES* Exemplified, In

Arithmetick,	*Astronomy,*
Geometry,	*Dialling,*
Military Affairs,	*Geography,*
Trigonometry,	*Navigation,* &c.

By WIL. LEYBOURN *Philom.*

To which is added a
SUPPLEMENT,
Containing the Description and some Uses, of a convenient Two-foot
JOYNT-RULE:
Upon which are inscribed divers Lines and Scales, sutable to all sort of Artificers occasions,

By JOHN BROWN.

THE LINE
OF
PROPORTION
Commonly called
GUNTER'S LINE.

A SECOND PART.

Wherein addition of other Lines which

Arithmetick,
Geometry,
Military Affairs,
Trigonometry,
Astronomy,
Dialling,
Geography,
Navigation, &c.

By WILLIAM LEYBOURN.

To which is added a

SUPPLEMENT,

Containing the Description and some
Uses of a Pocket-case Two Foot
JOINT RULE.

By THO. TUTTELL,

To the

READER.

THE Good Acceptance which the former Part of this BOOK hath received in the World (which was entituled, The Use of the Line of Proportion (or Numbers) commonly called Gunter's Line made easie) hath animated me to write some other Precepts, and to adde some other Proportional Lines of Mr. Gunter's first contrivance from

bis

To the Reader.

his Logarithmical Tables *of*
Artificial Sines *and* Tangents
upon a Strait Ruler.

In the First Part *I have prin-
cipally applied the* Line of
Numbers *to such kind of* Men-
surations *as are of daily use
amongst Workmen , as in the
Mensuration of* Board, Glass ,
Timber , Stone , Brick-work,
Tiling , Painting , Paving ,
Plaistering, Wainscotting , &c.
*of all which (and some other
Mensurations) I have given
there sufficient Rules and Ex-
amples. Wherefore I shall (in
this* Second Part *) omit to say
any thing of such matters or
things as I have at large hand-
led therein ; although all the*
Work

Work in that Book contained may be performed upon one of the Lines which is upon this Ruler, namely, by the Line of Numbers of two Radiusses; but shall principally discourse, or treat, of the Uses of such other Proportional Lines as are inscribed upon this Ruler, as now contrived: And yet I will not forbear to shew how to perform many Problems in the Former Part by this Ruler also; but they shall only be such, which by the Lines (as they are now disposed) may be wrought with less Trouble, more Speed, and the same Exactness; and many, which there (by the Single Line) required greatest trouble in their per-

A 3   formance,

To the Reader.

formance, *may be here done with the greatest* ease ; *nay, many (and those the most difficult) by inspection only, not medling with any other ; My principal aim in this* Second Part *being to shew such other Uses of the Common (or General) Line (*viz. the Line of Numbers *) together with such other Proportional Lines or Scales upon this Ruler inscribed, in the solution of the most useful and necessary Problems in* Arithmetick, Geometry, Astronomy, Geography, Navigation, Dialling, Trigonometry, *and several other of the* Mathematical Sciences, *as shall render it a most absolute and necessary Concometant, not only*

for

To the Reader.

for Artificers, *but for all sorts or degrees of Men, of what quality soever, that are any wayes inclinable to, or delighted in* Mathematical Practices.

And in order thereunto I *have under apt Heads and distinct Titles (and not miscellaniously) given variety of* Problems *and* Examples *in all the above-mentioned Sciences.*

I *shall not say more to induce you to the perusal of these Tractates, but commend you to the* Practice *of what is herein contained; and (besides the delight you will take therein, the benefit and profit you may*

re-

*receive thereby) will be suf-
ficient motives to induce you to
their perusal.*

*And now let me acquaint thee
Reader, that unto this Second
Part there is added a* Supple-
ment, *containing the* Descrip-
tion, *and some* Uses *(and those
not a few) of a convenient* Two-
foot Joynt-Rule.

*Thus have I given you a short
Account of what is contained
both in this* Second Part *and in
the* Supplement ; *both which
I commend unto thee, wishing
thee good success in thy perusal
and practice of them ; and in
a short time thou mayest expect
some other Treatises of this kind,
and*

To the Reader.

and of other *Parts of the Mathematicks also (some of them being almost ready for the Press :) from him who wishes thy welfare and the Advancement of Knowledge in the Common-wealth wherein he lives.*

London,
May 21. 1677.

Will. Leybourn.

✿✿✿✿✿✿✿✿✿✿✿✿✿✿✿

THE
LINE
OF
PROPORTION
Made EASIE.

A SECOND PART.

CHAP. I.

The description of the RULER,
and the manner how the se-
veral Lines upon it are to be
disposed.

THe Ruler may be made either
of Brass, Wood or Ivory, and
it may be a streight Ruler of
two Foot long or more, at
pleasure; or it may be in a streight

Rule or Scale but of one foot long, but then some of the lines will be very short, and the Division on them too small; Or Thirdly (and best of all) upon a Two-foot-Joynt-Rule, which opened will be the same as a streight Rule of two-foot long.

The Lines upon the Ruler are in Number Eight, besides Scales of equal parts, and of Chords, which may be upon the edges of the Ruler. But upon the flat of the Ruler (as I said before) Eight Scales or Lines.

I. The first, and uppermost is one single line of Numbers, containing the whole length (or very near) of the Rule, divided first into ten unequal parts, and those again subdivided into ten, so often as quantity will permit, according to the usual manner of dividing of such Lines.

II. Next

VI. Is a line of *Artificial Tangents* numbered unequally to 45 Degrees, and back again towards 90, so far as the Ruler will permit.

These two Lines of *Sines* and *Tangents*, are both of them of one Length or *Radius*, and are to be used with the fourth line of Numbers of 2 *Radiusses*.

VII. The seventh Scale is a Line of *Artificial Sines*, having 90 deg. in the middle of the Line, and then the Divisions are continued up beyond 90 deg. to the end of the Ruler, ending at 84 deg. 10 m. or rather at 174 deg. 10 m.

VIII. The eight Scale is a line of *Artificial Tangents*, which faceth the former line of Sines, having the *Radius* (or 45 deg.) in the middle of the Line, against 90 deg. of the *Sines*, and is continued up above 45 deg. to the end of the Ruler; where

where it terminates at 84 deg. 10 m. as the Sines do, and this avoids backward counting.

These two last lines of *Sines* and *Tangents* (being both of the same *Radius*) are to be used with the Fourth Line of *Numbers* of two *Radiusses*, and are of good use in the solution of *Spherical Triangles*, where Obtuse Angles are ingredient in the Question: And also when the *Tangent* given or required, exceeds 45 degrees.

I shall say no more concerning the Lines upon the Ruler, for every man being at liberty to insert such other as his particular occasion shall require, as *Chords*, *Equal parts*, a *Meridian-line*, and such like: In the Figure they are disposed in this Order.

The

The USE of the
PROPORTIONAL
LINES
IN
ARITHMETICK.

CHAP. II.

TO pass by *Numeration*, *Multiplication*, *Division*, the *Golden Rules* both *Direct* and *Reverse*, as also *Duplicated* and *Triplicated Proportions*, they being sufficiently treated of in the Seven first Chapters of the First part, I shall proceed to the work of the Ninth Chapter, which is

SEC-

SECTION I.

To Extract the Square Root *by the Lines.*

THe Rule delivered for the Extraction of the Square Root in the Ninth Chapter, is, [*Divide the space between* 1 *, and the number whose Root is to be Extracted into two eqaal parts , and the middle point shall fall upon the Root required.*] So the root of 36 being required , if you divide the space between 1 and 36 into two equal parts , the Compass point will rest upon 6 , which is the root of 36.——— Also the second *Example* of that Ninth Chapter requires the root of 256, the distance between 1 and 256 being divided into two equal parts , the Compasses will fall upon 16, the root of 256.

This is the way there prescribed , and is the only way to perform
B 4   that

that Work upon one single Line:
But as the lines are now dispo-
sed,

If upon the line of Numbers of
two *Radiuses*, you take the distance
between the middle 1 and 36, the
same distance set upon the 1 at the
beginning of the same Line shall
reach to 6 upon the broken Line.
Also the distance between the mid-
dle 1 and 256 being applyed to the
broken line from 1 in the middle
thereof, the point shall fall upon 16
in the broken Line, which is the
Square Root of 256.

SECTION II.

To Extract the Cube Root *by the
Lines.*

THis is the work of the Tenth
Chapter, and the Rule there
delivered for finding of the Cube
Root, is [*Divide the space between*

1 and the *Number* whose *Cube Root is
required*, into 3 *equal parts*, and the
Compass point will rest upon the Root.]
So, the Cube Root of 216 being re-
quired, the distance between 1 and
216 being divided into 3 equal parts,
the Compass-point will rest upon 6,
which is the Cube Root of 216.——
Also another *Example* in that Chap-
ter, is, to find the Cube Root of
1728, which is performed by di-
viding the space between 1, and
1728 into 3 equal parts, which be-
ing done, the Compass-point will
rest upon 12, which is the Cube
Root of 1728.

This is the way there prescribed;
but by these Lines,

If you take the distance between
the first 1 and 216 of the Line of
Numbers of 3 *Radiusses*, that distance
will reach from the third 1 of the
line of 3 *Radiusses* to 6, in the first and
B 5   greatest

greatest line of Numbers.———— Also,
the distance taken upon the Line of
Numbers of 3 *Radiusses* from the up-
permost 1 (which represents Thou-
sands) the same extent will reach
from 1, or 10, at the beginning of
the great Line of Numbers, to 12,
which is the Cube Root of 1728.
———— Likewise the distance from the
first 1 in the line of 3 *Radiusses* to 729,
being taken in the Compasses, and
applied to the third 1 in the same
Line, that extent will reach upon
the Great Line to 9, which is the
Cube Root of 729.

By the disposition of these several
Lines of Numbers in this Order,
you see that both the *Square* and
Cube Roots may be extracted by
once opening of the Compasses, but
that is not all, for there is yet a
greater *Compendium*, for by their
being disposed in this Order, both
the *Square* and the *Cube* Roots
                                    may

may be *Extracted*, and also the Root being given, the Square or the Cube thereof may be found by Inspection, without the help of the Compasses; and how to perform the same by these Lines, I shall now come to shew.

SECTION. III.

To extract the Square Root *of any Number by the Lines without Compasses.*

THis work is performed upon the Ruler by help of the Line of Numbers of two *Radinsses* and the Broken Line. Now when any number is given, and the Square Root thereof is required,

First, you must consider whether the figures in your number given being Integers, be Even or Odd: If your number given consist of even figures (as of 2, 4, 6, or 8) or of odd figures (as 1, 3, 5, 7, or 9.)

If

—— If the number being Integers, consist of even places, then count the number in the first *Radius* of the Line of two Radiusses; but if it consist of an odd number of Figures, count it in the second Radius of the same Line; in either of which cases (as one of them it will always be) right against your number, you shall find the *Square Root* thereof; which Root must consist of so many places as the number admits of *Periods*, or *Points* in the *Arithmetical Extraction*.

Example 1. Let 5276 (a number consisting of even places) be given, and let the *Square Root* be required: Count this number in the first Radius of the Scale, and right against it in the broken Line you shall find 72,65 the nearest *Square Root* thereof.

Example 2. Let 72796, a number of odd places be given, to find the *Square Root* thereof: Count

this number in the second Radius of
the Line , and right againſt it in
the broken Line , you ſhall find
269,8 , the *Square Root* thereof ;
which Root conſiſts of three Figures,
becauſe the Sum admits of three Pe-
riods or Points , by Extraction by
the Pen.

SECTION IV.

The Root being given, to find the Square
Number *thereunto belonging.*

THe beſt way to perform this, is
by *Multiplication* , and is eaſie
enough , but by the *Lines* thus.

1. When the Root given conſiſts
of one Figure, as an Integer , ſeek
the Integer in the ſingle Line of
Numbers once repeated , and right
againſt it, on the Line of two Ra-
diuſſes , is the *Square Number* , as it
is figured upon the Rule,

2. When the Root conſiſts of
two Figures , ſeek it in the ſingle
<div align="right">Line,</div>

Line, and right againſt it in the
Line of two Radiuſſes, is the *Square
Number* belonging to that Root; but
two Ciphers or Figures muſt be ad-
ded to the number found, and that
for the reaſon hereafter given.

3. When the Root conſiſts of
three Figures, ſeek it (as before)
in the ſingle Line, and againſt it,
in the Line of two Radiuſſes, you
ſhall have the *Square Number* an-
ſwering that Root, by adding four
Ciphers or Figures to the number
found.

Examples of all theſe Varieties.

1. The ſquare of 2 is 4, the ſquare
of 8 is 64, as figured on the Rule.

2. The ſquare of 20 is 400, by
adding of two Ciphers; the ſquare of
90 is 1800, by adding two Ciphers to
81, the Line as it is figured.

3. The ſquare of 146, is 21316,
by adding of four Figures to 2, the
number ſtanding againſt 146:
And

— And again, The Square of 450 is 202500, by adding of four Figures to 20, the number right against it.

Now to more number of Places than these, I presume none will attempt to approach by any Instrument how large soever; yet this may be a good guide to find the true number of Places: For, Look how many Figures you increase the Root more than on the Rule is expressed, twice so many is to be added to the square: For when 6 on the single Line is called 60, increased by one place, then 36 is called 3600, increased by two places; and when 7 is called 700, increased by two places; then must 49 the Root be 490000, increased by four places: and thus much shall serve for the Extraction of the *Square Root*, and finding of a *Square Number* answerable to a Root given.   S E C-

SECTION. V.

To Extract the Cube Root *of any Number by the Lines, without Compasses.*

THis work is performed upon the Ruler by help of the single Line of Numbers and the Line of three Radiusses facing the same. Now when any number is given, and the *Cube Root* thereof is required, you must consider whether your given number consists of 1,4,7, or 10 Places, or of 2,5, or 8 Places, or of 3, 6 or 9 places: For,

1. If the number do consist of 1,4,7, or 10 places, you must count it on the first Radius of the Treble Line, and right against it on the single Line you have the Root.

2. If the number consist of 2, 5, or 8 places, count it on the second *Radius*: And,

3. If the number consist of 3, 6,

or

or 9 places, count it in the third Radius, and against it on the single Line is the Root required; the Treble Line being figured accordingly from 1 to 1000, of 1, 2 and 3 places.

But the number of Figures in the Root, is according to the number of Points, that the number is capable of in Cubical Extraction by the Pen, the number being pointed at the first, fourth, seventh and tenth Figures, and so forwards, leaving two Figures between Point and Point, in this manner:

$$5 \; 2 \; 7 \; 9 \ . \ 1 \; 6 \; 7 \ . \ 3 \; 2 \; 5$$

And such a number as this, will have four Integers in the Root of it.

Examples of all these Varieties.

1. The *Cube Root* of 8 is 2, found right over it; 2. The *Cube Root* of 64 is 4, found right over it; 3. The
Cube

Cube Root of 729 found in the third
Radius, is but 9; becaufe fuch a
number of three places is capable but
of one point. Again, 4. The *Cube Root*
of 6859 found in the firft Radius
is 19, found right over it, in-
creafing the Root one Figure, as
the *Cube Number*, as to counting
on the Line, is increafed three Fi-
gures.

Laftly, The *Cube Root* of 15625
is 25, of two places increafed 1, as the
Cube Number is increafed 3, as to
counting on the Lines.

SECTION VI.

A Cube Root *given, to find the* Cube
Number *thereto belonging.*

THis is beft done by fquaring the
Root given, and multiplying that
Product by the Root again, by the
Pen, but by the Lines thus as be-
fore; the Root being directly found
on the fingle Line, on the treble
Line

Line is the direct answer, or *Square Number* required.

But when the Root is increased by a Figure, the *Cube Number* must be increased by three Figures, when the Root is increased two Figures, the *Cube Number* must be increased six Figures.

Example, The *Cube* of 2 is 8, the *Cube* of 4 is 64, the *Cube* of 9 is 729 directly, so as the Rule gives it.

But the *Cube* of 20, the 2 increased by one Figure, is in the treble Line 8000, increased three Figures, the *Cube* of 80 is 512000; being three Figures more than 512 the *Cube* of 8.

Again, The *Cube* of 150, being two Figures more than 1 and $\frac{1}{2}$, is increased by six Figures more than $3\frac{171}{1000}$, the Cube of 1 and $\frac{1}{2}$, *viz.* 3375000

The *Cube Root* of a small Number and Fraction is found as any whole Number: *Example*, The *Cube Root* of

of 38, and $\frac{5}{12}$ is 3 $\frac{11}{100}$ but to pretend
to fractions of great *numbers*, by the
Line, is to lose your expectation;
but a *Cube Root* may be given to four
places, by a good Line in integers, or
integers and fractions, and then the
Cube number will consist of ten places,
and so much for *Cube Roots* by Inspe-
ction only.

SECTION VII.

Of Reduction *of* Vulgar Fractions *to*
Decimal Fractions *by the* Line.

The Proportion is,

AS the Denominator of the Vul-
gar Fraction, is to its Nume-
rator : So is Vnity, or 1, to the Nu-
merator of a Decimal Fraction,
equal in Value to the Vulgar Fra-
ction.

Example 1. *What Decimal Fracti-*
on is equal to $\frac{11}{24}$?

<div align="right">Extend</div>

Extend the Compasses from 84 the Denominor, to 63 the Numerator, the same extent will reach from 1 (the same way) to 75, or $\frac{75}{100}$, which is a Decimal Fraction equal in Value to $\frac{63}{84}$, 100 being the Denominator.

Example 2. What Decimal Fraction is equal to $\frac{7}{21}$?

Extend the Compasses from 21 to 7, the same will reach from 1 to ,33, so that 33 hundred parts is equal in Value to $\frac{7}{21}$ *fer.*

SECTION VIII.

Of Simple Interest by the Lines.

Question I.

IF 100 l. in 12 moneths, do gain 6 l. how much shall 326 l. gain in the same time?

As 100 : is to 6 :: So is 326 : to 19,56.

Etxend

Extend the Compasses (on the Line of Numbers of two *Radiusses*) from the middle 1, downwards, to 6, the same extent will reach from 326, downwards, to 19,56, which is 19 *l*. 11 *s*. 2½ *d*. And so much will the Interest of 326 *l*. gain in 12 *moneths*. Also you may by the same work find that 270 *l*. will gain in 12 *moneths*, 16,4 or 16 *l*. 8 *s*.

Question 2.

What is the Interest of 175 *l*. 18 *s*. *and* 11 *d*. *for a year, at* 6 *l*. *per Cent. for a year?*

You must first turn the 175 *l*. 18 *s*. and 11 *d*. into a Decimal Fraction, (either as I have taught in my Arithmetick, or by such a brief Table as this following) and it will be 175,9458 *l*. Which done, extend the Compasses from 1, downwards, to 6, the same extent will reach, downwards, from 175,9458 to 10,5542; which reduced by the following Table

Table (or otherwise) is 10 *l.* 11 *s.*
1½ *d.* for the Interest of 175 *l.* 18 *s.*
11 *d.* for a Year.

A Table to Reduce English Money into Decimal Parts, and the contrary.

Shill.	Deci.	Shill.	Deci.	P.	Deci.	Fart.	Deci.
20	,100	10	,50	11	,0458	3	,0031
19	,95	9	,45	10	,0417	2	,0021
18	,90	8	,40	9	,0375	1	,0010
17	,85	7	,35	8	,0333		
16	,80	6	,30	7	,0292		
15	,75	5	,25	6	,0250		
14	,70	4	,20	5	,0208		
13	,65	3	,15	4	,0167		
12	,60	2	,10	3	,0125		
11	,55	1	,05	2	,3083		
				1	,0042		

1. As 100 : 10 :: 823 : to 19,68.

2. A 50 :: :: 50 20 : 10

Question 3.

What will the Interest of 784 *l.* for
9 moneths amount to at 6 *l.* in the 100 *l.*
for a Year ?

1. As

1. As 100 : is to 6 :: so is 784 : to 47,04.

2. As 12 m. : is to 47,04 :: so is 9 m. : to 35,28.

Extend the Compasses from 1 to 6, downwards, the same extent will reach downwards from 784 to 47,04, which is the Interest of 784 l. for a year, or 12 moneths.

Again, Extend the Compasses from 12 moneths, to 47,04, the same extend will reach, the same way, from 9 moneths, to 35,28, which reduced is 35 l. 5 s. 7 d. 1 q. almost, for the Interest of 784 l. for 9 moneths.

Question 4.

What will the Interest of 328 l. amount unto in 20 dayes, at 6 p. Cent for a year?

1. As 100 : to 6 :: so 328 : to 19,68.

2. As 365 : to 19,68 :: So 20 : to 1,075.

Extend the Compasses from 100 to 6, the same extent will reach, the

is

same way from 328 to 19,68, which
is the Interest of 328 *l*. for a year, or
365 days.

Again, Extend the Compasses
from 365 days to 19,68, the same
Extent, the same way, will reach from
20 days to 1,075, which is the Inte-
rest of 328 *l*. for 20 days, and the
Fraction reduced is, 1 *l*. 1 *s*. 6 *d*. 3 *q*.

Quest. on 5.

If I receive 60 *l*. 8 *s*. and 4 *d*. for
the Interest of 755 *l*. 5 *s*. for a year,
what Interest have I allowed in the
100 *l*. for a year?

Reduce 60 *l*. 8 *s* 4 *d*. into a Deci-
mal, and it is 60,1616. Also re-
duce 755 *l*. 5 *s*. into a Decimal Fra-
ction, and it is 755,25. Then the
Proportion will be,

As 755,25 : to 60,1616 :: So is
100 : to 8.

Extend the Compasses from 755,
25, downwards, to 60,16, the same
extent will reach the same way from

100 to 8, which is the Rate of Inte-
rest that was received.

SECT. IX.

Of Anatocisme *or Compound Interest*
by the Lines.

Question I.

To find what the Interest of any sum
of Money, with the Principal, will be
increased unto in any number of years,
and at any Rate of Interest?

LEt it be required to find unto
what sum of Money 143 *l.* 10 *s.*
will be increased unto in 10 years,
accounting Interest upon Interest at
6 *l. per. Cent. per Annum* for 100 *l.*

The Proportion is

As 100 *l.*
        Is to 106 , the increase of
            100 *l.* in a year,
    So is 143 *l.* 10 *s.*

To

To the increase thereof in a year,
which being 10 times repeated
upon the Line, shall at last rest
upon the sum both of Princi-
pal and Interest in 10 years.

Wherefore,

Extend the Compasses from 100,
to 106 upon the single Line of Num-
bers; the same extent being set to
143 *l.* 10 *s.* (or 143,5) and 10 times
repeated upon the Line, the same
way, the point of the Compasses
at the tenth remove, shall rest upon
257 *l.* and to so much will 143 *l.*
10 *s.* be increased to in 10 years.

Question 2.

*What is any sum of Money due any
number of years to come, worth in
present Money; discounting interest up-
on interest at any rate proposed?*

Let it be required to find what
257 *l.* due at 10 years end, is worth
in ready Money, allowing 6 *l. per*

Cent. Compound Interest. This Problem is but the converse of the former : For,

The extent of the Compasses between 100 and 106, being placed upon 257, and removed backwards ten times; at the tenth remove you shall find the Compass point to rest upon 143,5, which is 143 *l.* 10 *s.* and so much is the 257 *l.* due at 10 years end, worth in ready Money.

Question 3.

If a Yearly Rent or Anunity, be forborn a certain number of years, what will the arrearages thereof amount unto at the expiration of the time, at any rate of interest proposed?

Suppose an Anunity or Rent of 10 *l.* a year be forborn for 4 years, what is the Rent and the arrearages thereof worth at the expiration of the 4 years, allowing 8 *l. per Cent.* profit for the forbearance?

The

The Proportion is,

(1) As 8 *l.* : is to 100 *l.* :: so is
10 *l.* : to 150 *l.*

Extend the Compasses from 8 to
100, the same extent (the same
way) will reach from 10, to 125.

Then, by the first Question, you
may find that 125 *l.* forborn for 4
years at 8 *per Cent.* will be worth
170 *l* from which sum if you sub-
stract 125 *l.* the remainder will be
45 *l.* and so much will the Annuity
and the forbearance be worth in
ready money, at 8 *per Cent.*

Question 4.

*What is a Lease or Annuity, to conti-
nue a certain number of years, worth
in ready money, the Purchaser propo-
sing to himself a certain Rate of inte-
rest for the laying out of his money?*

Suppose a Lease to be worth 12 *l.*
a year, and of that Lease there is

16 years to come : What may be
given for this Leaſe, and the buyer
have 10 *l. per Cent. per Annum* profit
for his Money?

The Proportion is,

As 10 *l.* : is to 100 *l.* Principal : : ſo is
12 *l.* : to 120 *l.* Principal.

Extend the Compaſſes from 10
(upon any of the ſmaller Lines of
Numbers) to 100, the ſame extent
ſhall reach from 12 to 120 ; then find
by the fore-going Queſtions what
120 *l.* being forborn 16 years, will
be worth, which amounts to 551 *l.*
Principal and Intereſt ; from which
ſum take 120 *l.* the Principal, and the
remainder will be 431 *l.* the Arrears :
Then (by the 2d Queſtion) find what
431 *l.* due after the expiration of 16
years, is worth in preſent Money
at 16 *l. per Cent.* and the anſwer will
be 93 *l.* 14 *s.* and ſo much is that Leaſe
or Annuity for 16 years worth.

Queſtion

Question 5.

What Anunity, to continue any number of years, will a proposed sum of money purchase, so that the Purchaser may have 10 l. per Cent. profit for his money laying out?

Let 500 l. be proposed to belaid out in an Anunity, to continue 16 years, and the Purchaser will have 10 l. per Cent. profit ; what will the 500 l. purchase per Annum?

By the last Question you found that 93 l. 14 s. will purchase 12 l. a year for 16 years, at 10 per Cent ; this known, the proportion will hold,

As 93,7 : to 12 :: so is 500 l. : to 64 l.

Extend the Compasses from 93,7 to 12, the same extent will reach the same way, from 500 l. to 64 l. and such an Annuity for 16 years will 500 l. purchase, and the pur-

C 4   chaser

chaser gain 10 *l. per Cent. per Annum* for his Money laying out.

SECT. X.

Of the Rule of Fellowship or Company, by the Lines.

Five Men , as A, B, C, D, *and* E, *make a Banck or Stock of Money to trade withal , in all* 300 *l. of which*

		Stock	Gain
A		84	14
B		72	12
C	Put into Stock	48	8
D		54	9
E		42	7
	In all	300	50

By this Stock in a certain time they gain 50 *l.* Now it is required to know how much of this 50 *l.* each person must have to ballance the Money he put in?

The Proportion is

As 300 *l.* the whole Stock, Is to 50 *l.* the whole gain : So is every Mans share put in, To his particular profit.

Extend the Compasses from 300, downwards to 50, the same extent will reach from 84 (which was the Stock which *A* put in) to 14, for the share of *A.* And the same extent will reach from 72 the Stock of *B.* to 12 the share of *B*, and so the rest as is above expressed.

A Question of Fellowship with Time.

Two Merchants accompany, D. put into Stock 100 l. for 4 months, E. put in 136 l. for 3 months, and they gained 50 l. how much must each Merchant have of the profit ?

The Proportion will be

(1) As 1 : is to 4 months :: so is 100 *l.* : to 400.

C 5   (2) As

(2) As 1, is to 3 months .: so is
136 *l.* : to 408.

Extend the Compasses from 1, to
4. the same extent will reach from
100, to 400l, *A.* his Money and
Time multiplied together. Again,

Extend the Compasses from 1, to
3, the same extent will reach from
136, to 408, *B.* his Time and Money
multiplied. The sum of both is 808.

Then for each Merchants share,

(1) As 808 is to 50 *l.* :: so is 400 :
to 24,75 for *D.*

(2) As 808 : to 50 *l.* :: so is 408.:
to 25,25 for *E.*

Extend the Compasses from 808
to 50, the same extent will reach
the same way from 400 to 24,75,
which is the Gain belonging to *A. D.*
and the same extent will reach from
408 to 25,25, which is the gains be-
longing to *E.*

So that $\begin{Bmatrix} E \\ D \end{Bmatrix}$ must have $\begin{Bmatrix} 25 & 05 & s. \\ 24 & 15 \end{Bmatrix}$

The whole Gain 50 00

The

The USE of the
PROPORTIONAL
LINES
IN
GEOMETRY.

CHAP. III.

SECT. I.

Of Superficial and Lineal Measures.

I Shall be very brief in these kind of Measures, as also in the second Section, concerning Solid Measures, because in the First Part there are plenty of Examples of both kinds; so that here I shall only

only give you a Miscellany of Geometrical Problems, for the farther illustrating the Uses of the Proportional Lines.

Question 1.

How many foot is contained in a Plank, whose breadth is $17\frac{1}{2}$ inches, and $27\frac{1}{4}$ foot long?

The Extent from 12 to $17\frac{1}{2}$ inches the breadth, will reach from $27\frac{1}{4}$ the length in feet, to $39\frac{1}{4}$ the Content of the Board in feet.

Or if the breadth and length were given in Foot Measure, then

The Extent from 1, to 1,46, the breadth, the same extent will reach from 27,25 the length, to 39,78, the Content in Feet.

Question 2.

If a Board be $21\frac{1}{2}$ inches broad at one end, and $16\frac{1}{2}$ at the other end, and 40 foot long, how many foot is there contained?

Adde

Add 21 ½ and 16 ½ together, the
sum is 38; the half whereof is 19,
then,

The extent from 12 inches to 19
inches, will reach from 40 the length,
to 63 and almoſt a quarter, for the
Content.

What is here ſaid of *Board*, is to be
underſtood of *Paving* , *Plaiſter-
ing*, *Flooring*, *Wainſcotting*, or any
other *Superficial Meaſure* ; as I
have elſewhere exemplified.

Queſtion 3.

If a Brick Wall be 37 *foot long*, 26 ½
foot high , *and* 3 ½ *Bricks thick* , *how
many Rod doth this Wall contain* , *it
being reduced to one Brick and half
thick* , *which is the Standard thickneſs
for Brick-work ?*

(1) As 1 is to 29 ½ the height,
ſo is 37 the length, to 980 ½ the Su-
perficial Content.

(2) As

(2) As 272 ¼ (the number of feet in one Rod , is to 1 ; so is 980 ½, to 3 Rod ½, and 14 parts over.

Extend the Compasses from 1 to 26 ½ the height , the same extent will reach from 37 the length to 980,5. Again,

Extend the Compasses from 272 ¼ the Feet in one Rod, downwards to 1 ; the same extent will reach from 980,5 downwards to 3,5 Rod , and 14 Decimal parts over : Wherefore set one Foot of the same extent of the Compasses in 14, and the other shall reach upwards to 38 foot, so that the Wall contains 3 Rod ½ and 38 Foot.

But being the Wall is 3 ½ Bricks thick , and it must be reduced to one Brick and half thick , Take this general proportion for the reducing Brick-work from any thickness to Brick and half.

As

As 3

Is to the number of half Bricks
that any Wall is in thicknefs
(as here 7.)

So is the number of Feet contain-
ed in the Superficies of tthe Wall
(as here 980½.)

To the number of Feet that the
Wall contains, being reduced
to one Brick and half (as here
2286.)

Again for the Rods,

As 272¼ is to 1: So is 2286, to
8¼ Rod and 42 Foot.

(1) Extend the Compaffes from
3 to 37, the fame extent will reach
from 980,5 to 2286.

(2) Extend the Compaffes from
272¼ downwards to 1, the fame ex-
tent will reach the fame way from
2286 to 8¼ Rod and 15 Decimal
parts over; wherefore fet one foot
of the fame extent in 15, and the
other

other shall reach upwards to 42 foot;
so the whole Wall reduced is 8¼ Rod
42 Foot.

Question 4.

How to find the Aera of a Regular
Poligon of 5,6,7,8 *, or any other num-*
ber of Sides.

Measure the distance from the Cen-
ter to the middle of one of the Sides,
which suppose 32 inches, and let the
side of the Poligon be 24 inches, and
let there be 8 sides in the Poligon:
that is 192 inches in all the sides,
the half is 96, then say:

As 1 is to 32 the Perpendicular,
  so is 96 the half Perimiter of the
  Poligon, to 3072 the Area of
  the whole Poligon.

Extend the Compasses from 1 to
32, the same will reach from 96
to 3072.

Question. 5.

If the Diameter of a Circle be 14 *inches, and the Area thereof* 154 *inches, what shall be the Area of another Circle, whose Diameter is* 28 *inches?*

Out of the broken Line, take the distance between 14 and 28 (the 2 Diameters) the same extent shall reach upon the same Line of 2 Radiusses, from 154 the lesser Area, to 616 the Area of the Circle, whose Diameter is 28.

Question 6.

If a Piece of Land that is 20 *Pole square, be worth* 30 l. *what shall another piece of Land of the same goodness be worth, that is* 35 *Pole square?*

Take the distance between 20 and 35, out of the broken Line (but because you cannot conveniently take it from that, take it out of the single Line) that distance applied to the

Line

Line of 2 Radiuſſes, will reach from 30, to 91,8, that is 91 *l*. 16 *s*. and ſo much will the piece of Land be worth, whoſe Side is 35 Pole.

Queſtion 7.

If the Area or Content of a Circle be 154, whoſe Diameter is 14, what ſhall the length of the Diameter of that Circle be, whoſe Area is 616?

Out of the Line of two Radiuſſes, take the diſtance between 154 and 616, the ſame extent applied to the ſingle Line, ſhall reach from 14 to 28, the Diameter of the greater, Circle.

Queſtion 8.

There is a piece of Land 20 Pole ſquare, and is worth 30 l. and there is another piece of the ſame Land worth 91 l. 16 s. how many Pole ſquars ought that piece of Land to be?

Out of the Line of 2 Radiuſſes
take

take the diſtance between 30, and
91,8, the ſame diſtance applied to
the broken Line (or to the ſingle
Line) will reach from 20 to 35; and
ſo many Pole ſquare ought the o-
ther piece of Land to be.

Queſtion 9.

How many Acres of Land of Engliſh
meaſure (16,5 foot going to the Pole)
are contained in 30 Acres of Iriſh
meaſure, where 21 foot goes to the
Pole?

Take out of the broken Line the
diſtance between 16,5 and 21, the
ſame extent will reach from 30 to
48,6 upon the Line of 2 Radiuſſes,
and ſo many Engliſh Acres are con-
tained in 30 Iriſh Acres.

Queſtion 10.

The Baſe 65, and Perpendicular 76,
of a Right-an led Triangle, being given,
to find the Hypothenuſe?

Seek

Seek 65 and 76 in the broken Line, and right againſt 65 you ſhall find 4225, and againſt 76 you find 5776 in the Line of 2 Radiuſſes: theſe added together make 10001 which found in the Line of 2 Radiuſſes, againſt it in the broken Line, you ſhall find 100 and ſomewhat more for the length of the Perpendicular.

Queſtion 11.

The *Hypothenuſe* 100, *and one Side* 65, *of a Right-angled Triangle, given, to find the other Side?*

Seek 100, and 65 in the broken Line, and in the Line of 2 Radiuſſes you ſhall find 10000 againſt 100, and 4225 againſt 65: Subſtract 4225 from 10000, and the remainder will be 5775, which found in the Line of 2 Radiuſſes, againſt it in the broken Line, you ſhall find 76 for the length of the other ſide.

Queſtion

Question 12.

The three Sides of an Obtuse-angled Triangle are 80, 40, and the longest side subtending the Obtuse Angle is 100, how far without the Obtuse shall the Perpendicular fall?

Find 80 and 40 in the broken Line, against which in the Line of 2 Radiusses, you shall find 6400 and 1600; these two added make 8000, which substracted from 10000 the Square of the third side 100, there remains 2009, the half whereof is 1000, and that divided by 40, gives 25 for the distance of the Perpendicular from the Obtuse Angle.

Question 13.

The same three Sides given, as before, 80, 40, and 100, to find where the Perpendicular shall fall from the Obtuse Angle?

Find

Find 80 and 100 in the broken Line, against which in the Line of 2 Radiusses you shall find 6400, and 10000 which make 16400, from which substract 1600, the square of 40, the third Side, and the remainder will be 14800, the half whereof is 7400, which divided by 100, the Quotient will be 74, the length upon the Base where the Perpendicular will fall.

Question 14.

The three sides of any Triangle 100, 80, *and* 40 *being known, to find the Area, without knowing of the Perpendicular?*

First add the three sides together, their sum is 220, the half sum 110, from this half sum substract each side severally, and the several distances will be 10,30, and 70. Multiply any 2 of these differences together, and the product of them by the third difference,

[right column, partially visible:]

fere
210
sum
23

fai
ot
a l
D

ference, so shall the last Product be 21000, which multiply by the half sum 110, and that Product will be 2310000, whose Square Root is the Area of the Triangle. Wherefore, take (or count) 2310000 out of the Line of 2 Radiusses, and that extent will reach upon the single Line, from the beginning to 1520, the Root of 2310000, equal to the Area of the Triangle.

Question 15.

The two Diameters of an Ellipsis 32 *and* 24, *being given, to find the Area of the Ellipsis?*

Extend the Compasses from 1 to either of the Diameters (as 32) the same extent shall reach from 24 (the other Diameter) to 768 the Area of a Rectangle Figure, made of the two Diameters : Then,

As

As 100 : to 78,54 ::
So is 768, to 603,19

Extend the Compasses from 100,
to 78,54 (a fixed Area) the same will
reach from 768 (the Rectangled Fi-
gure made of the two Diameters)
to 603,19, the Area of the Ellipsis.

Question 16.

To find the Diameter of a Circle
whose Area shall be equal to the Area
of the former Ellipsis?

Upon the Line of Numbers of two
Radiusses, open the Compasses from
24 to 32 the two Diameters of the
Ellipsis, that distance applied to the
single Line, will reach from 24 the
lesser Diameter, to 27,71 the Dia-
meter of a Circle, whose Area shall
be equal to the Area of the Ellipsis.

Question

Quest. 17.

The Chord Line 60,8 *, and Altitude* 14 *, of the Segment of any Circle, being known, to find out the other parts of the Circle and the Area of the Circle ?*

1. Extend the Compasses from 1 to 30,4 , half the Chord of the Arch , and that distance again repeated from 30,4 , will reach to 924,16, the square of half the Arch Line.

2. Extend the Compasses from 14 (the Altitude of the Arch) to 1,the same will reach from 924,16, to 66, to which if you adde 14 the Altitude of the Arch, the sum will be 80,for the Diameter of the Circle , the half whereof 40 , is the Radius of the Circle.

3. Adde half the Segments Chord 30,4 , and the Segments Altitude 14, together,they make 44,4,whose

D   Square

Square Root is 6,67 *fere*, and is the
length of the Chord of half the Seg-
ments Arch.

SECT. II.

Of Solid Measures.

Quest. 1.

If a piece of Square Timber be 15
inches broad, 22 *inches deep, and* 20
*foot long : how many sol d foot are con-
tained therein?*

Extend the Compasses upon the
Line of two Radiusses, from 15 in-
ches the breadth, to 22 in the depth,
that extent shall reach from 15 up-
on the single Line , to $18\frac{1}{4}$ inches,
for the true square at the end, then
your proportion will be

As 12 inches,
To the inches square $18\frac{1}{4}$,

So

So is the length in feet 20,

To a fourth ; and that fourth to 46 foot.

Extend the Compasses from 12 to 18¼ , the same will reach from 20 the length , at twice turning the Compasses, to 46 , the quantity of feet contained in the whole piece.

Or in Foot Measure.

Extend the Compasses from 1,25, the breadth, to 1,84 the depth, upon the Line of two Radiusses, that distance applied to the single line, shall reach from 1, 25 to 1,52.

Again , Extend the Compasses from 1 to 1,52 , the same extent shall reach from 20 , at twice turning of the Compasses , to 46 the content of the Piece in Feet.

D 2   *Quest.*

Question 2.

If a Piece of Tapering Timber be 2,2 foot, and 0,41 foot at one end, and 1,32 foot, and 1,75 foot at the other end, and 12 foot long; how many solid foot is contained in this Piece of Timber?

1. Upon the Line of two Radiusses, take the distance between 1, and 0,41, the same extent will reach downwards from 2,2, to 0,90, for the content of the Base at the little end.

2. Upon the same Line take the distance between 1 and 1,32, the same extent will reach from 1,75, to 2,31, the content of the greater end.

3. Extend the Compasses from 1, downwards to 90, the Area of the lesser Base, the same extent will reach from 2,31, the Area of the greater Base, to 2,08, the product of

of the two ends multiplied toge-
ther, the Square Root where-
of is 1,44 : Add this Root
and the two Bases together,
their sum is 4,65. Then again,

Extend the Compasses from
1 to 4 (which is one third of
the length of the piece) the same
extent shall reach from 4,65, to
18,60 the true content of the whole
piece.

```
                              0,90
                              2,31
                              1,44
                             ─────
                              4,65
```

Question 3.

*If a Cube, whose side is 12 inches,
doth contain 1728 Cubical inches, how
many Cubical inches shall a Cube con-
tain, whose side is 8 inches?*

Out of one of the Lines of 3 Ra-
diusses take the distance from 12 to
8, the difference of sides, that same
distance applied to the single Line,
shall reach from 1728 downwards
to 512, the solid inches in a Cube,
whose side is 8 inches.

D 3 *Quest.*

Question 4.

If a Bullet, or Sphear, being 6 inches Diameter, do weigh 30 l. what shall a Sphear of the same metal weigh, whose Diameter is 7 inches?

Take the distance between 6 and 7 out of the Line of 3 Radiusses, the same extent applied to the single line, will reach from 30, to 47,7, and so much will a Bullet of the same metal weigh, whose diameter is 7 inches.

Question 5.

If a Ship of 300 Tun burthen, be 75 foot by the Keel, what burthen shall that Ship be, whose Keel is 100 foot?

The distance between 75 and 100, being taken out of the Line of three Radiusses, applied to the single Line, will reach from 300 Tun, to 713 the burthen of that Ship, whose Keel is 100 foot.

Quest.

Queſtion 6.

If a Ship of 300 Tun, be 29,5 foot at the Beam; what ſhall the length of the Beam of that Ship be, whoſe burthen is 713 Tun?

Out of the ſingle Line, take the diſtance between 300 and 713, that ſame extent applied to the Line of three Radiuſſes, ſhall reach from 29,5, to 39,35, for the length of the Beam of a Ship, whoſe burthen ſhall be 713 Tun.

Queſtion 7.

If a Ship of 300 Tun be 13 foot in Hold, what ſhall that Ship be in Hold, whoſe burthen is 713 Tun?

Out of the ſingle Line, take the diſtance between 300 and 713, that diſtance applied to the Line of three Radiuſſes, ſhall reach from 13, to 17,35, and ſo much ſhall that Ship

D 4.   be

be in Hold, whoſe burthen is 713 Tun.

Queſtion 8.

If a Braſs Piece of Ordnance, whoſe Diameter is 11,5 inches, do weigh 1900 pounds, what ſhall another Piece weigh, (of the ſame ſhape) whoſe Diameter is 8,75 inches?

The Extent between 11,5 and 87,5 taken upon the broken Line of three Radiuſſes, will reach upon the ſingle Line, from 1900 to 837 ; and ſo much ſhall that Piece weigh, whoſe Diameter at Bore is 8,75.

The

The USE of the
PROPORTIONAL
LINES
IN
Military Affairs.

CHAP. IV.

SECT. I.

Quest. I.

How to order any number of Soldiers into a Square Battail ; so that there shall be as many in Rank as in File?

LET it be required to make a Square Battail of 2704 men, so that there be as many in Rank as in File.   D 5   For

Forasmuch as the number of Souldiers do consist of an even number of Figures, seek that number 2704, in the first Radius of the Double Line of Numbers, and right against it in the Broken Line, you shall find 52, and so many must be in Rank, and as many in File : And these Souldiers, if they be imbattelled at Order (which is 3 Foot in Rank and as much in File) then will they occupy 24336 square foot of Ground; which by the Lines you may thus find.

Extend the Compasses from 1 to 3 (the distance in Rank and File) the same extent will reach from 52 to 156; find 156 upon the Broken Line, and against it in the Double Line you shall find 24336, the Ground that these Souldiers will occupy, being at their Order of 3 foot.

Quest.

Quest. 2.

Any number of men being proposed, to place them in Battalia, in such order that there may be as many more in Rank as in File, and that they may stand at Close Order, which is 1½ foot?

LEt the number given be 2602, count the half thereof 1301, upon the Double Line, and against it you shall find in the Broken Line 36, which is the depth in File, and then there must be 72 in Rank, which is twice 36.

Now for the Ground that these will occupy, being at Close Order,

As 1 : is to 1,5 :: so is 36 : to 54: and so is 72 to 1080.

Extend the Compasses from 1 to 1,5, the same extent will reach from 36 (the depth of men in File) to 54 the side of the Ground. ----- Again, the

the same extent will reach from 72 (the Front of the men in Rank, to 1080 the length of the Ground. —— Then for the Area,

Extend the Compasses from 1 to 1080, the same extent will reach from 54 to 58320, and so many square foot of Ground will these 2602 men occupy at Close Order.

Quest. 3.

Any number of men being proposed to be put in Battalia, and a certain number named to be either in Rank or File, to find the other number?

LEt it be required to place 872 men in Battalia, so that there shall be 8 in File, how many must there be in Rank; or how many Files must there be?

The Proportion to work this is,

As 8, the depth in File,
   Is to 872, the number of Soul-
      diers,   So

So is 1, to 109 the number of men in Rank.

Extend the Compasses from 3, to 87, the same extent (the same way) will reach from 1, to 109.

Quest. 4.

Any number of Souldiers being given, together with their distance in Rank and File, to order them into a Square Battail of Ground?

LEt the number of Souldiers given be 3000, their distance in File 7 foot, and in Rank 3 foot;

The Proportion holds,

As 7 : to 3 : : so is 3000 : to 1286.

Extend the Compasses from 7, downwards to 3, the same extent will reach from 3000, downwards to 1286.

Seek 1286 in the first Radius of the Broken Line, and just against it

you

you shall find 35,7, the number of
men to be placed in File — 35 men
is too little and 36 men will be too
much ; but men are not to be di-
vided in parts.

Quest. 5.

*How to order any number of souldiers
into Rank and File , so, that their
distance in Rank shall be to the di-
stance in File , in such proportion as
any two numbers given are ?*

IF 3000 souldiers were to be or-
dered in Rank and File , so that
the distance between Rank and Rank
shall be in proportion to the di-
stance between File and File , as 5
is to 9 (that is) if the men in File
stand 9 foot asunder , the men in
Rank shall stand 5 foot asunder.

The Proportion is,

As 5 : to 9 :: so is 3000 : to 5400.

Extend the Compasses from 5 to
9,

9, the same extent will reach from 3000 to 5400 —— Seek 5400 in the Double Line of Numbers, and against it in the Broken Line, you shall find 73,5, for the number of men in Rank. —— Then for the number of men in File,

As 73,5 : is to 1 :: so is 3000 to 41 *fere.*

Extend the Compasses from 73,5 to 1, the same extent will reach from 3000 to 41, and so many men must be in File —— But here the number of men are 3013, which 13 over must be supplied, or else 28 men must be taken off and disposed of as Scouts, Centinels, or the like; otherwise there must be one File less.

Quest:

Quest. 6.

There are 8100 in a square Battail drawn up, and it is required to have 6 Ranks of Pikes to arme the same square Body round about; how many Ranks must there be in the whole square Battail, and what number of Pikes and what of Musketeers?

THe Square Root of 8100 is 90, the number of men in Rank and File; now for that there must be 6 Ranks of Pikes about the Musketeers, there will be 12 Ranks less of them both in Front and Flank, than in the whole Body : wherefore subtract 12 from 90, there will remain 78, which number find in the Broken Line of Numbers, and right against it you shall find 6084, the number of Musketeers, and that taken from 8100, there remains 2061, for the number of Pikes.

SECT.

SECT. II.

Concerning the Quartering of Souldiers by the Lines.

Quest. I.

If 1000 *Souldiers may be lodged or quartered in a square of* 300 *foot of Ground, how many foot long must the side of a square be, that the Ground included may lodge* 5000 ?

EXtend the Compasses from 1 to 300 (the side of the Square which will lodge 1000 Souldiers) the same extent will reach forward from 300 to 90000, then

The Proportion will be

As 1000 : is to 5000 :: so is 90000 : to 450000.

Seek this number in the Double Line of Numbers, and against it in
<div align="right">the</div>

the Broken Line you shall find 671, and so much must the side of a Square be, that must lodge 5000 Souldiers with the same convenience that 1000 Souldiers were lodged in a Square whose side was 300 foot.

According to this Method may all Questions of this kind be resolved.

CHAP. V.

Definitions and Theorems Trigonometrical.

1 A Triangle is a Figure consisting of three Sides and as many Angles ; as is the Triangle C A B, in *Fig.* I.　　　2. Any

2. Any two Sides of a Triangle are called the Sides of the Angle contained by them ; as the Sides C B and A B, are the Sides containing the Angle C B A.

3. The meaſure of an Angle is the quantity of the Arch of a Circle, deſcribed upon the angular Point , and cutting both the Sides containing the Angle.

4. A Degree is the 360 part of any Circle. Therefore,

5. A Semicircle contains 180 degrees.   And

6. A Quadrant (or right Angle) contains 90 degrees.

7. The Complement of an Angle leſs than 90 degrees , is ſo much as that Angle wanteth of 90 degrees.

8. The Complement of an Angle to a Semicircle , is ſo much as that Angle wanteth of 180 degrees.

9. An Angle is either Right, Acute, or Obtuſe.

10. A Right Angle is that whoſe
mea-

meafure is 90 degrees, or a Quadrant.

11. An Acute Angle is lefs than a right Angle, and alwayes contains lefs than 90 degrees.

12. An Obtufe Angle is greater than a right Angle, and alwayes contains more than 90 degrees.

13. A Triangle is either right-angled or oblique-angled.

14. A right-angled Triangle is fuch a Triangle as hath one right Angle. As the Triangle C A B, (*Fig. I.*) hath one right Angle, namely, that at A, which containeth juft 90 degrees.

15. In every right-angled Triangle. that Side which fubtendeth (or lieth oppofite to) the right Angle is called the *Hypotenufe* ; and of the other two Sides, the one is called the *Perpendicular* , and the other the *Bafe* , at pleafure: But moft commonly the fhorter fide is called the Perpendicular, and the longer the Bafe.

Bafe.   Thus in the Triangle C B A,
B C is the Hypotenufe, C A the Per-
pendicular, and A B the Bafe.

16. In every right-angled Trian-
gle, if you have one of the acute
Angles given, the other is alfo given,
it being the Complement thereof to
90 degr.   As in the Triangle C A B,
if you have the Angle at C 53 degr.
7 min. given, you have alfo the An-
gle at B given, it being the Comple-
ment of that at C to 90 degr. where-
fore take 53 degr. 7 min. from 90
degrees, and there will remain 36
degr. 53 min, which is the quanti-
ty of the Angle at B.

17. In all right-lined Triangles
whatfoever (either right-angled or
oblique-angled) the three Angles to-
getner are equal to two right Angles,
or contain 180 degrees: Therefore,
if you have any two Angles of a
Triangle given, you have alfo the
third given, it being the Comple-
ment of the other two to 180 de-
grees:

grees : Thus, in the Triangle C D B, *Fig. II.* if there were given the Angle C D B, 43 deg. 20 min. and the Angle C B D 14 degrees 40 min. I say, by consequence you have the third Angle D C B also given, it being the Complement of the other two to 180 degr. For the two given Angles B D C 43 degr. 20 min. and C B D 14 degr. 40 min. being added together, make 58 deg. which being taken from 180 degr. there will remain 122 deg. the quantity of the obtuse Angle D C B.

18. In all Triangles whatsoever, the Sides are in proportion one to the other as the Sines of the Angles opposite to those Sides. So in the Triangle C D B, the Sine of the Angle at D, is in proportion to the Side C B, which is opposite to it, as the Sine of the Angle at B, is to the Side C D, or the Angle at C, to the Side D B.

These

These things being premised, I come now to the Solution of *Plain Triangles* both *Right* and *Oblique* angled.

I. Of *Right angled Plain Triangles.*

THE Triangle which I shall make use of in the several Cases belonging to a *Right-angled Plain Triangle*, shall be that *Fig. I.* noted with C A B, In which

		parts	
A B the Base,		180	
C A the Perpendicular,	}contains	135	
C B the Hypotenuse,	}	225	
And		deg.	m.
A the Right Angle,		90 —	00
C the Angle at the Per.	}contains	53 —	07
B the Angle at the Base,		36 —	53

CASE I.

The Base B A 180, *and the Perpendicular* C A 135, *being given, to find the Angles* B *and* C.

The

The Proportion is,

As the Logarithm of A B
   Is to the Logarithm of A C,
So is the Radius,
   To the Tangent of B.

Extend the Compasses from 180 the Base, to 135 the Perpendicular, upon the Line of Numbers, the same extent will reach, the same way, from the Radius (or Tangent of 45 deg.) to the Tangent of 36 deg. 53 min. the quantity of the Angle at B.

CASE II.

The Hypotenuse C B 225, *and the Base* A B 180, *being given, to find the Angles B and C.*

The Proportion is,

As the Logarithme of C B,
   Is to the Radius ;

E   So

So is the Logarith. of the Side A B,
    To the Sine of C.

Extend the Compasses from 225
the Hypotenuse, to the Radius (or
Sine of 90 degr.) the same extent
will reach, the same way, from 180
the Base, to 53 deg. 7 min. the quantity of the Angle at C.

Or,

The distance between 225 and
180, will reach from the Sine of 90,
to the Sine of 53 degr. 7 min. as
before.

CASE III.

*The Base A B 180, the Angle C 53
    degr. 7 min. and the Angle B 36
    deg. 53 min. being given, to find the
    Perpendicular C A.*

The Proportion is,

As the Sine of the Angle at C,
    Is to the Logar. of A B,
So is the Sine of the Angle B,
    To the Logar of C A.

Or,

Or,

As the Radius,
  Is to the Logar. of A B,
So is the Tangent of B,
  To the Logar. of C A.

Extend the Compasses from the
Sine of 53 deg. 7 min. the Angle at
C, to 180 the Base, the same ex-
tent will reach from the Sine of
36 degr. 53 min. to 135 the Perpen-
dicular C A.

Or,

Extend the Compasses from the
Tangent of 45 deg. to 180 the Base,
the same extent will reach, the same
way, from the Tangent of 36 deg.
53 min. to 135 the Perpendicular,
as before.

CASE IV.

The Hypotenuse CB 225, the Angle
C 53 deg. 7 min. and the Angle at
B 36 deg. 53 min. given, to find
the Base B A, and the Perpendicular
C A.   E 2   The

The Proportion is,

As the Radius,
  Is to the Logar. of C B,
So is the Sine of C,
  To the Logar. of A B.
And the Sine of B,
  To the Logar. of C A.

Extend the Compasses from the
Sine of 90, to 225 the Hypotenuse,
the same extent will reach from the
Sine of 53 deg. 7 min. the Angle
at C, to 180 the Base A B ———
And likewise, the same extent will
reach from the Sine of 36 deg.
53 min. to 135, the Perpendicu-
lar C A.

CASE V.

*The Hypotenuse C B 225, and the Base
A B 180, being given, to find the
Perpendicular C A,*

The

The Proportion is,

1. *Operation.*

As the Logar. of C B,
  Is to the Radius ;
So is the Logar. of A B,
  To the Sine of C.

2. *Operation.*

As the Radius ,
  Is to the Logarithm of C B,
So is the Sine of B (the Comple-
    ment of C)
To the Logar. of C A.

Extend the Compasses from 225
the Hypotenuse, to the Sine of 90,
the same extent will reach from 180
the Base, to the Sine of 53 degr.
7 min. the Angle at C.

Again,

Extend the Compasses from the
Sine of 90, to 225 the Hypotenuse,
the same extent will reach from the
Sine of 36 degrees 53 minutes, the
    E 3   Angle

Angle at B , to 135 the Perpendicular C A.

CASE VI.

The Base AB 180, *the Angle C* 53
degr. 7 *min. and the Angle B* 36
degr. 53 *min. being given , to find
the Hypotenuse C B.*

The Proportion is,

As the Sine of C,
    Is to the Logar. of A B ;
So is the Radius,
    To the Logar. of C B.

Extend the Compasses from the
Sine of 53 degr· 7 min. to 180 the
Base , the same extent will reach
from the Sine of 90 , the Angle at
A , to 225 the Hypotenuse C B.

CASE VII.

The Base A B 180 , *and the Perpendicular C A* 135 , *being given, to find
the Hypotenuse C A.*   The

The Proportion is,

1. *Operation.*

As the Logar. of A B,
Is to the Logar. of C A;
So is the Radius,
To the Tangent of B.

2. *Operation.*

As the Sine of B,
Is to the Logarithm of C A,
So is the Radius,
To the Logar. of C B.

Extend the Compasses from 180
the Base, to 135 the Perpendicular,
the same extent will reach from the
Tangent of 45 degrees (or Radius)
to the Tangent of 36 degr. 53 min.
the Angle at B.

Again,

Extend the Compasses from the
Sine of 36 deg. 53 min. the Angle
at B, to 135 the Perpendicular C A;
the same extent will reach from the

Sine

Sine of 90 degrees, to 225 the Hypotenuſe G B.

> *Theſe are the Seven Caſes of* Right
> angled Plain Triangles , *I come*
> *now to the ſolution of the Five*
> *Caſes of* Oblique-angled Plain
> Triangles.

II. *Of Oblique-angled Plain Triangles.*

THE Triangle which I ſhall make
  uſe of in the Solution of the ſe-
veral Caſes appertaining to an *Ob-*
lique-angled Plain Triangle , ſhall be
that *Fig. II.* noted with C D B : In
which,

		pants
D B the Baſe,		335
C B the longer Side,	contain	271
D C the ſhorter Side,		100

		deg.	m.
C, the Obtuſe Angle,		122 — 00
D, ⎱ the 2 Acute Angles,	contains	43 — 20
B, ⎰		14 — 40

In

In the Solution of this *Oblique-an-gled Triangle*, I call the longest Side D B the Base, and the other two, the two Sides, without any other distinction, as of *Hypotenuse* or *Perendicular* ; for in these Triangles (taken entirely of themselves) there is no such distinction properly to be made.

CASE I.

Two Sides, as the Base D B 335 *, and the Side C B* 271 *, and the Angle D* 43 *deg.* 20 *min. opposite to C B, to find the Angle at C, opposite to the Base D B.*

Extend the Compasses from 271, the Side B C, (upon the Line of Numbers) to the Sine of 43 deg. 20 min. the Angle at D , the same extent will reach from 335 the Base D B (upon the Line of Numbers)

E 5

to the Sine of 58 deg. the Comple-
ment of the Obtuse Angle at C, to
180 deg. which is 122 deg.

CASE II.

The Base D B 335, and the Side DC
100, with the Angle D, 43 degr.
20 min. contained between them, to
find either of the other Angles at B
and C.

IN the solution of this Problem,
you must first get the Sum and the
Difference of the two given Sides.

Also you must get the Half sum of
the two unknown Angles, in this
manner,

The two given sides are $\begin{cases} DB \\ DC \end{cases}$ 335
100

Their Sum 435

Their difference 235

The

deg. m.

The given Angle is 43 20

Which fubtracted from⎰ 136 40
180 deg. leaves ——⎰

This 136 deg. 40 m. is the quantity
of both the Angles at C and B,
The half whereof is 68 20

Being thus prepared,
The Proportion is,

As the Logar. of the fum of the
two Sides given, C D and C B,
Is to the difference of thofe
Sides;
So is the Tangent of half the Sum
of the two unknown Angles C and B,
To the Tangent of half their
difference.

Extend the Compaffes from 435
(the Sum of the two Sides D B and
D C) to 235 (the difference of the
fame two Sides) that extent will
reach from the Tangent of 68 deg.
20 min. (the half fum of the two
unknown

unknown Angles C and B) to the
Tangent of 53 deg. 40 min.

This 53 deg. 40 min. being added
to 68 deg. 20 m. (the half ſum of
the Angles B and C) gives 122 deg.
for the greater Angle C, and being
ſubtracted from 68 deg. 20 min.
leaves 14 deg. 40 min. for the leſſer
Angle at B.

CASE III.

The three Sides D B 335 , *C B* 271,
and D C 100, *being given, to find
any of the Angles, as B.*

BEfore you can reſolve this Pro-
blem , you muſt obtain the Sum
and Difference of the two Sides con-
taining the Obtuſe Angle, thus,

$$\text{The Side} \begin{Bmatrix} CB \\ CD \end{Bmatrix} \text{is} \begin{Bmatrix} 271 \\ 100 \end{Bmatrix}$$

Their Sum 371

Their difference 171
The Baſe is 335
Which

Which being known,

The Proportion is,

As the Logarithm of the greater Side D B,

Is to the Sum of the other two Sides, D C and C B;

So is the difference of the two Sides,

To a fourth Sum,

Which fourth Sum, being taken from the Base, will leave another number, the half whereof will be the place in the Base where a Perpendicular let fall from the Obtuse Angle, would fall upon the Base: and so the Oblique Triangle is reduced into two Right-angled, and may be resolved by the Precepts of Right-angled Triangles,

Extend the Compasses from 335 (the greatest Side, to 371 (the sum of the other two sides C D and C B) the same extent will reach from

171

171. (the difference of the same sides) to 189,4.

This number 189,4 (being substracted from the Base DB 335) there will remain 145,6, the half whereof is 72,8 , which is the length of the Base from D to E; in which point a Perpendicular let fall from the Obtuse angle C, will fall : and so the Obtuse angled Triangle CDB , is reduced into two Right-angled Triangles C E D and C E B , and any of the parts of either of them may be found by the precepts for the resolving of Right-angled Triangles.

CASE IV.

The three Angles C 122 *degr.* D 43 *degr.* 20 *min. and* B 14 *degr.* 40 *min. being given , to find any of the Sides, as* B C.

IN this Case , where the three Angles are given , and a Side required,

red, no abſolute proportion can be
preſcribed; for the Sides cannot ab-
ſolutely be found, but their propor-
tions one to another may be obtain-
ed; for that the three Angles of one
Triangle may be equal to the three
Angles of another Triangle, al-
though their Sides be altogether un-
equal.

CASE V.

*The two Sides D C 100, and C B 271,
with the Angle at C 122 degr. be-
ing given, to find the Baſe D B.*

YOu muſt firſt find (by the fore-
going Caſes the two Angles at
D and B : Making choice of one
of the Sides, as C D, to work your
Proportion by: Then,

The Proportion will be,

As the Sine of B,
    Is to the Sine's Compl. of C;

So

So is the Logarithm of C D,
   To the Logarithm of D B.

Extend the Compaſſes from the
Sine of 14 degr. 40 min. the Angle
at B , to the Sine of 58 degr. the
Complement of the Angle at C , to
180 deg. the ſame Extent will reach
(upon the Line of Numbers) from
100 the Side C D, to 335 the Side
D B.

*And theſe are all the Caſes that
   can ariſe in the Solution of
   any Oblique-angled Trian-
   gle , I will proceed to the
   Solution of Spherical Tri-
   angles.*

SPHERICAL
TRIGONOMETRY.

I. Of Right-angled Spherical Triangles.

THe Right-angled Spherical Tri-
angle, which I shall make use
of in the following XVI. Cases, shall
be the Triangle CBA, *Fig. IV.*
right-angled at A; the quantity of
each Side and Angle being as fol-
loweth; *viz.*

	d. m	Comp.
The Hypoteruse C B	30 00	60 00
The Base B A	27 54	62 06
The Perpendicular C A	11 30	78 30
Angle at the { Base B	23 30	66 30
Perpendicular C	69 36	20 24

CASE

CASE I.

The Hypotenuse and Angle at the Base given, to find the Perpendicular.

The Proportion is,

As Radius 90,
   Is to Sine B C 30,
So is Sine B 23 deg. 30 min.
   To the Sine C A 11 deg. 30 min.

Extend the Compasses from the Sine of 90, to the Sine of 30, the same extent will reach from the Sine of 23 deg. 30 min. to the Sine of 11 deg. 30 min. the Perpendicular.

CASE II.

The Hypotenuse and Perpendicular given, to find the Base.

The Proportion is,

As the Co-sine C A 78 deg. 30 m.
   Is to Radius 90,

So

So is Co-fine C B 60 ,
To Co-fine B A 62 deg. 6 min.

Extend the Compasses from the
Sine of 78 deg. 30 min. to 90, the
same extent will reach from the Sine
of 60 deg. to the Sine of 62 deg.
6 min. the Base.

CASE III.

The Angles at the Base and Perpendi-
cular given , to find the Perpendi-
cular ?

The Proportion is,

As Sine C 69 deg. 36 m.
Is to Co-fine B 66 deg. 30 m.
So is Radius 90 deg.
To Co-fine C A 79 deg. 30 m.

Extend the Compasses from the
fine of 69 deg. 36 min. to the fine
of 90 , the same extent will reach
from the fine of 66 deg. 30 min. to
the fine of 79 deg. 30 min. the com-
plement of the Perpendicular.

CASE

CASE IV.

*The Base, and Angle at the Base given,
to find the Perpendicular.*

The Proportion is,

As Radius 90 deg.
　Is to sine B A 27 deg. 54 min.
　So is tangent B 23 deg. 30 min.
　　To tangent C A 11 deg. 30 min.

Extend the Compasses from the
sine of 90 , to the sine of 27 deg.
54 min. the same extent will reach
from the tangent of 23 deg. 30 m.
to the tangent of 11 deg. 30 m. the
Perpendicular.

CASE V.

*The Perpendicular and Angle at the
Base given, to find the Base.*

The Proportion is,

As tangent B 23 deg. 30 min.
　Is to tangent C A 11 deg. 30 m.
　　　　　　　　　　　So

So is Radius 90 degr.
To fine B A 27 deg. 54 min.

Extend the Compasses from the
tangent of 23 deg. 30 min. to the
tangent of 11 deg. 30 min. the same
extent will reach from the fine of
90 deg. to the fine of 27 deg. 54 m.
for the Base.

C A S E   VI.

The Hypothenuse and Angle at the Per-
pendicular given , to find the Per-
pendicular.

The Proportion is,

As Radius 90 deg.
To co-fine C 20 d. 24 m.
So is tangent B C 30 deg.
To tangent C A 11 deg. 30 m.

Extend the Compasses from the
fine of 90 deg. to the fine of 20 deg.
24 min. the same extent will reach
from the tangent of 30 degr. to
the

the tangent of 11 deg. 30 min. the
perpendicular.

CASE VII.

The Angles at the Bafe and Perpendi-
cular given , to find the Hypothe-
nufe.

The Proportion is ,

As tangent C 69 deg. 36 min.
  Is to the co-tangent B 66 d. 30 m.
So is Radius 90 d.
  To co-fine C B 60 d.

Extend the Compaffes from the
tangent of 69 d. 36 m. to the tan-
gent of 66 d. 30 m. the fame extent
will reach from the fine of 90 d. to
the fine of 60 d. for the comple-
ment of the Hypothenufe.

CASE VIII.

The Bafe and Perpendicular given , to
find the Hypothenufe.

The

The Proportion is,

As Radius 20 d.
Is to co-sine B A 62 d. 6 m.
So is cosine C A 79 d. 30 m.
To the co-sine C B 60 d.

Extend the Compasses from the
sine of 90 deg. to the sine of 62
deg. 6 min. the same extent will
reach from the sine of 79 d. 30 m.
to the sine of 60 d. for the com-
plement of the Hypothenuse.

CASE IX:

*The Perpendicular and Angle at the
Base given, to find the Hypothenuse*

The Proportion is,

As sine B 23 d. 30 m.
Is to Radius 90 d.
So is sine C A 11 d. 30 m.
To the sine C B 30 d.

Extend the Compasses from the
sine of 23 d, 30 m. to 90 d. the same
ex-

extent will reach from the sine of
11 d. 30 m. to the sine of 30 d. for the
Hypotenuse.

CASE X.

The Base, and the Angle at the Base, given, to find the Hypotenuse.

The Proportion is,

As Radius 90 d.
   Is to co-sine B 66 d. 30 m.
   So is co-tangent B A 62 d. 6 m.
    To the co-tangent B C 60 d.

Extend the Compasses from the
sine of 90 , to the sine of 66 deg.
30 m. the same extent will reach
from the tangent of 62 d. 6 m. to
the tangent of 60 d. for the comple-
ment of the Hypotenuse.

CASE XI.

*The Perpendicular and Angle at the
Perpendicular given, to find the
Angle at the Base.*

The

The Proportion is,

As Radius 90,
Is to Sine C 69 d. 36 m.
So is Co-sine C A 79 d. 30 m.
To Co-sine B 66 d. 30 m.

Extend the Compasses from the sine of 90 deg. to the sine of 69 d. 36 m. the same will reach from the sine of 79 deg. 30 min. to the sine of 66 deg. 30 min. for the Complement of the Angle at the Base.

CASE XII.

The Perpendicular and Angle at the Base given, to find the Angle at the Perpendicular.

The Proportion is,

As the Co-sine C A 79 d. 30 m.
Is to Co-sine B 66 d. 30 m.
So is Radius 90 degr.
To Sine C 69 d. 36 m.

F   Extend

Extend the Compasses from the fine of 79 deg. 30 min. to the fine of 66 deg. 30 min. the fame extent will reach from the fine of 90 deg. to the fine of 69 deg. 36 min. for the angle at the Perpendicular.

CASE XIII.

The Hypotenuse and Perpendicular given, to find the Angle at the Base.

The Proportion is,

As the Sine B C 30 deg,
Is to Radius 90 deg.
So is Sine C A 11 d. 30 m.
To Sine B 23 d. 30 m.

Extend the Compasses from the fine of 30 deg. to the fine of 90 degr. the fame will reach from the fine of 11 deg. 30 m. to the fine of 23 deg. 30 min. for the angle at the Base,

CASE XIV.

CASE XIV.

The Base and Perpendicular given, to find the Angle at the Base,

The Proportion is,

As Sine B A 27 d. 54 m.
Is to Radius 90 d.
So is Tangent C A 11 d. 30 m.
To Tangent B 23 d. 30 m.

Extend the Compasses from the sine of 27 deg. 54 min. to the sine of 90 degrees, the same extent will reach from the tangent of 11 degr. 30 min. to the tangent of 23 degr. 30 min. for the angle at the Base.

CASE XV.

The Hypotenuse and Perpendicular given, to find the Angle at the Perpendicular,

F 2   The

The Proportion is,

As the Tangent B C 30 d.
    To the Tangent C A 11 d. 30 m.
So is Radius 90 degr.
    To the Co-sine C 20 d. 24 m.

Extend the Compasses from the
tangent of 30 degr. to the tangent
of 11 deg. 30 min. the same extent
will reach from the sine of 90 deg.
to the sine of 20 degr. 24 min. for
the complement of the angle at the
Perpendicular.

CASE XVI.

The Hypotenuse and Angle at the Per-
pendicular given, to find the Angle
at the Base.

The Proportion is,

As Radius 90 d.
Is to Co-sine C B 60 d.

So

So is Tangent C 69 d. 36 m.
To Co-tangent B 66 d. 30 m.

Extend the Compasses from the sine of 90 deg. to the sine of 60 deg. the same extent will reach from the tangent of 69 degr. 36 min. to the Tangent of 66 degr. 30 min. for the Complement of the Angle at the Base.

These 16 Cases are all that can be proposed in a Right-angled Spherical Triangle. There are 12 other Cases which belong to Oblique-angled Spherical Tri-angles, which we now come to resolve.

F 3   H. *Of*

II. Of Oblique-angled Spherical Triangles.

THE Triangle which I shall make use of in the solution of the 12 Cases of Oblique-angled Spherical Triangles, shall be *Fig. IV.* Z S P, whose Sides and Angles are as followeth; *viz.*

		d.	m.	Comp.
	S P	70	00	20 00
The Side	Z P	38	30	51 30
	Z S	40	00	50 00

		d.	m.	Comp.
	Z	130	8	49 52
The Angle	S	30	24	59 36
	P	31	32	58 28

The Perpendicular Z R.

The Segment	S R	35	54	54 06
	P R	34	06	55 54

CASE I.

CASE I.

Two Sides Z P *and* Z S , *and the Angle* S, *opposite to* Z P, *given, to find the Angle* P *opposite to the other side* Z S.

The Proportion is,

As Sine Z P 38 d. 30 m.
Is to the Sine S 30 d. 24 m.
So is Sine S Z 40 d. 0 m.
To Sine P 31 d. 32 m.

Extend the Compasses from the Sine of Z P 38 deg. 30 min. to the Sine of S 30 deg. 24 min. the same extent will reach from the Sine of S Z 40 deg. to the Sine of 31 deg. 32 min. the Angle at P.

CASE II.

Two Angles Z *and* P , *with the Side* S P, *opposite to* Z *given, to find the Side* S Z, *opposite to the Angle* P.

F 4   The

The Proportion is,

As Sine Z 130 d. 8 m.
Is to Sine S P 70 d.
So is Sine P 31 d. 32 m.
To Sine S Z 40 d.

Extend the Compasses from the
Sine of 49 deg. 52 min. (the Com-
plement of 130 deg. 8 min. to 180
deg.) to 70 deg. the same extent
will reach from 31 deg. 32 min. to
the Sine of 40 degr. for S Z.

In the resolving of the following
Cases of Oblique Spherical Tri-
angles, it will be necessary to re-
duce the Oblique Triangle into
two Right-angled Triangles;
which must be effected by letting
fall of a Perpendicular from an
Angle upon a Side opposite there-
unto; and for the letting fall of
this Perpendicular, observe these
few following Directions.

Directions

Directions for the letting fall of the Perpendicular in any Oblique Spherical Triangle.

1. The Perpendicular must fall from an unknown Angle upon a Side opposite thereto.

2. By the Perpendicular so let fall, the Oblique Triangle is reduced into two Right-angled Triangles.

3. The Perpendicular falls sometimes within the Triangle, sometimes without ; *viz.*

When the Angles at the ends of that Side upon which the Perpendicular is to fall, be { both { Acute Obtuse { { The Perpend. falls { { Within One Acute and the other Obtuse, { { { Without.

That Side must always be the Base, upon which the Perpendicular is to fall; and must be extended (if need require.)

F 5   CASE

CASE III.

Two Sides S Z and S P, with the Angle S included between them, given, to find the opposite Angle P.

IN this Case the Base is that given side which is adjacent to the Angle sought, namely S P.

The Proportion is,
1. *Operation.*

As Radius 90 d.
   Is to Co-sine 59 d. 36 m.
So is Tangent Z S 40 d.
   To Tangent S R 35 d. 54 m.

2. *Operation.*

As Sine S R 35 d. 54 m.
   To Sine R P 34 d. 6 m.
So is Tangent S 30 d. 24 m.
   To Tangent P 31 d. 32 m.

I.
Extend the Compasses from Radius 90 deg. to 59 deg. 36 min. the
same

same extent will reach from Tangent 40 deg. to the Tangent of 35 deg. 54 min. for S R.

II.

Extend the Compasses from the Sine of 35 deg. 54 min. to the Sine of 34 deg. 6 min. the same extent will reach from the Tangent of S 30 deg. 24 min. to the Tangent of 31 deg. 32 min. for the Angle at P.

CASE IV.

Two Sides Z P *and* P S, *with the Angle* P *included between them, given, to find the Side* Z S, *opposite to the given Angle* P.

IN this Case the Base is one of the given Sides.

The Proportion is,

1. *Operation.*

As Radius 90 d.
Is to Cosine P 58 d. 28 m.

So

So is Tangent Z P 38 d. 30 m.
To Tangent P R 34 m.

2. Operatirn.

As Co-sine P R 55 d. 54 m.
Is to Co-sine S R 54 d. 6 m.
So is Co-sine Z P 51 d. 30 m.
To Co-sine Z S 50 d.

I.

Extend the Compasses from the Sine of 90 deg. to the Co-sine of P 58 deg. 28 min. the same extent will reach from the Tangent of Z P 38 deg. 30 min. to the Tangent of 34 deg. 6 min. for P R.

II.

Extend the Compasses from the Co-sine of P R 55 deg. 54 min. to the Co-sine of S R 54 deg. 6 min. the same extent will reach from the Co-sine of Z P 51 deg. 30 min. to the Co-sine of 50 deg. for Z S.

CASE

CASE V.

Two Sides Z P *and* S P, *with the Angle* P *contained between them, given, to find the Angle* S, *opposite to the Angle* P.

The Proportion is;

1. *Operation.*

As Radius 90 d.
   Is to Co-fine P 58 d. 28 m.
So is Tangent Z P 38 d. 30 m.
   To Tangent R P 34 d. 6 m.

2. *Operation.*

As Sine P R 34 d. 6 m.
   Is to Sine S R 35 d. 54 m.
So is Tangent P 31 d. 32 m.
   To Tangent S 30 d. 24 m.

I.

Extend the Compasses from Radius 90 deg. to the Co-sine of P 31 deg. 32 min. the same extent will reach from the Tangent of Z P 38 deg.

deg. 30 min. to the Tangent of 30
deg. 24 min. for the Angle at S.

II.

Extend the Compasses from the
Sine of P R 34 d. 6 m. to the Sine
of S R 35 d. 54 m. the same extent
will reach from the Tangent P 31
deg. 32 m. to the Tangent of 30
deg. 24 m. for the Angle at S.

CASE VI.

Two Sides Z P *and* Z S, *with the An-*
gle P *opposite to* S Z, *given, to find*
the Angle Z, *contained between the*
two given Sides.

IN this Case the Base is always the
Side unknown.

The Proportion is,
1. *Operation.*

As Radius 90 d.
    Is to Co-sine Z P 38 d. 30 m.
                                    So

So is Tangent P 31 d. 32 m.
To Tangent R Z P 25 d. 38 m.

2. *Operation.*

As Tangent Z S 40 d.
Is to Tangent Z 38 d. 30 m.
So is Co-sine R Z P 64 22 m.
To Co-sine S Z R 58 d. 44 m.

I.

Extend the Compasses from Radius 90 deg. to the Co-sine of Z P 51 deg. 30 min. the same extent will reach from the Tangent of P 31 deg. 32 min. to the Tangent of 25 deg. 38 min. for the Angle R Z P.

II.

Extend the Compasses from the Tangent of Z S 40 deg. to the Tangent of Z P 38 deg. 30 min. the same extent will reach from the Co-sine of R Z P 64 deg. 22 min. to the Co-sine of 31 deg. 16 min.

CASE

CASE VII.

Two sides Z S and Z P, with the angle S opposite to Z P given , to find the side S P adjacent to the given angle S.

The Proportion is,
1. *Operation.*

As Radius 90 d.
Is to co-sine S 59 d. 36 m.
So is tangent Z S 40 d.
To tangent S R 35 d. 54 m.

2. *Operation.*

As co-sine S Z 50 d.
Is to co-sine Z P 51 d. 30 m.
So is co-sine S R 54 d. 6 m.
To co-sine P R 55 d. 54 m.

I.

Extend the Compasses from Radius 90 deg. to the co-sine of S 59 d. 36 m. the same extent will reach, from the tangent of Z S 40 deg. to the tangent of S R 35 deg. 54 min.

II.

II.

Extend the Compasses from the co-sine of S Z 50 deg. to the cosine of Z P 51 deg. 30 min. the same extent will reach from the co-sine of S R 54 deg. 6 min. to the co-sine of P R 55 deg. 54 min.

CASE VIII.

Two angles S and Z, with the side S Z included between them given, to find the angle P opposite to the given side S Z.

IN this Case the Base may be either of the unknown sides.

The Proportion is,

1. *Operation.*

As Radius 90 d.
Is to co-sine S Z 50 d.
So is tangent S 30 d. 24 m,
To co-tangent R Z S.

2. *Operation.*

2. *Operation.*

As fine R Z S
    To fine R Z P;
So is co-fine S 59 d. 36 m.
    To co-fine P 58 d. 28 m.

I.

Extend the Compasses from Radius 90 deg. to the co-fine of S Z 50 deg. the same extent will reach from the tangent of S 30 degrees 24 minutes, to the co-tangent of R Z S.

II.

Extend the Compasses from the fine of R Z S to the fine of R Z P, the same extent will reach from the co-fine of S 59 degrees 36 minutes, to the co-fine of P 58 degrees 28 minutes.

CASE

CASE IX.

Two angles Z and P, with the side
Z P between them, given, to find the
side Z S opposite to the given angle
at P.

IN this Case the Base is the side
neither given nor sought as S P.

The Proportion is,
1 *Operation.*

As Radius 90 d.
   Is to co-fine Z P 51 d. 30 m.
So is tangent P 31 d. 32 m.
   To co-tangent R Z P.

2. *Operation.*

As co-fine R Z S
   Is to co-fine R Z P,
So is tangent Z P
   To tangent Z S

I.

Extend the Compasses from Ra-
dius 90 degr. to the co-fine of Z P
                  51 degr.

51 degr. 30 min. the same extent will reach from the tangent of P 31 degr. 32 min. to the co-tangent of R Z P.

II.

Extend the Compasses from the co-sine of R Z S, to the co-sine of R Z P, the same extent will reach from the tangent of Z P 38 deg. 30 min. to the tangent of Z S 40 degrees.

CASE X.

Two angles S and P, with a side opposite to one of them S Z, given, to find the other angle Z.

IN this Case the Base is the side opposite to the angle sought.

The Proportion is,
1. Operation.

As Radius 90 d.
Is to co-sine Z S 50 d.

So

So is tangent S 30 d. 24 m,
   To co-tangent S Z R.

2. *Operation.*

As co-sine S 59 d. 36 m,
  Is to co-sine P 58 d. 28 m,
  So is sine S Z R,
    To sine R Z P.

I.

Extend the Compasses from Radius 90 degr. to the co-sine of Z S 50 degr. the same extent will reach from the tangent of S 30 degr. 24 min. to the co-tangent of S Z R.

II.

Extend the Compasses from the co-sine of S 59 degr. 36 min. to the co-sine of P 58 d. 28 m. the same extent will reach from the sine of S Z R to the sine of R Z P.

CASE

CASE XI.

The three sides S Z, P Z, *and* S P, *given, to find an angle, viz the angle at* Z.

IN this Case the side opposite to the inquired angle is the Base.

Before the Triangle can be resolved, you must

First, Adde the three sides together, and note the sum of them.

Secondly, Take the half thereof, which call the half sum.

Thirdly, From the half sum, substract the Base, and note the difference, as you see here done.

The Side $\begin{cases} SZ & 46 & 00 \\ ZP & 38 & 30 \\ SP & 70 & 00 \end{cases}$

The Sum   148 30

The half Sum   74 15

From which substract the Base 70 deg there remains the difference $\begin{cases} \\ \end{cases}$ 4 15

This

This preparation being made,
the proportion will be,

1 *Operation.*

As Radius 90 d.
   Is to sine Z S 40 d.
So is the sine of Z P 38 d. 30 m.
      To a fourth sine, *viz.* 23 d. 35 m.

2 *Operation.*

As the sine of 23 d. 35 m.
   Is to the sine of the half sum
      74 d. 15 m.
So is the sine of the difference
   4 d. 15 m.
      To a seventh sine, *viz.* 10 d. 17 m.

I.

Extend the Compasses from Radius 90 deg. to the sine of Z S 40 deg. the same extent will reach from the sine of Z P 38 deg. 30 min. to a fourth sine, *viz.* 23 deg. 35 min.

II.

Extend the Compasses from the sine of 23 deg. 35 min. to the sine of
      the

the half sum 74 degr. 15 min. the
same extent will reach from the sine
of the difference 4 deg. 15 min. to a
seventh sine, *viz.* 10 deg. 17 min.

Divide the space upon the Line of
Sines betwen 10 deg. 17 min. and
90 degr. into two equal parts , and
the Compass point shall rest upon
24 deg. 56 min. whose Complement
is 65 deg. 4 min. and that doubled
makes 130 deg. 8 min. for the an-
gle at Z.

CHAP. XII.

The three angles Z, S, and P, given, to
find a side.

THis is but the converse of the
former Case, and may be resol-
ved in the same manner , if for ei-
ther of the angles next to the side re-
quired, you take its complement to
180 deg. those angles will be turned
into sides, and the sides into angles,
and then may the triangle be resolved
as in the preceding Case.

The

The

some things which in this Tractate
may be omitted, or at least, for bre-
vity, lightly passed over.

Probl. I.

The distance of the Sun *from the near-*
est Æquinoctial Point (either Ari-
es or Libra) *59 deg. given, to find*
his Declination.

The Proportion is,

As the Radius 90 deg.
   Is to the Sine of the Sun's greatest
     Declination 23 deg. 30 m.
So is the Sine of the Sun's distance
    from the next Æquinoctial Point
    Libra 59 degr.
To the sine of the Sun's present
    Declination 20 degr.

Extend the Compasses from the
sine of 90, to the sine of 23 deg. 30
min. (the Suns greatest Declinati-
on) the same extent will reach from
59 deg. (the Suns distance from
                     Libra,

Libra, to the sine of 20 deg. the Suns present Declination.

The like Declination the Sun *hath when he is in* 29 *degr. of* Taurus, *in* 1 *degr. of* Leo, *or* 29 *degr. of* Scorpio, *every of which Points are distant from one of the* Æquinoctial *Points* Aries *or* Libra 59 *deg.*

Probl. II.

The Latitude *of the Place*, 51 *deg.* 30 *min. and the* Declination *of the* Sun 20 *deg. being given, to find the* Ascensional Difference.

The Proportion is,

As the co-tangent of the Latitude 38 deg. 30 min.

Is to the tangent of the Suns Declination 20 degr.

So is the Radius 90 deg.

To the sine of the Ascensional Difference 27 deg. 14 min.

G 2   Extend

Extend the Compasses from the tangent of 38 deg. 30 min. the complement of the Latitude, to 20 deg. (the Suns Declination) the same extent will reach, the same way, from the sine of 90 deg. to the sine of 27 deg. 14 min. the Ascensional difference; which is the quantity of time that the Sun rises or sets before or after Six of the Clock.

So these 27 degr. 14 min. being turned into Time (by allowing 15 deg. for one hour, and one degree for 4 minutes of Time) is 1 hour and 49 min. and so much doth the Sun rise or set before or after the hour of Six, according to the time or season of the year ; for if the Sun hath *North Declination* , then he *riseth before six* and *sets after:* but if the Sun have *South Declination*, then doth he *rise after*, and *sets before Six.*

This Ascensional Difference *being added to Six hours , will give you the* Se-

Semidiurnal Arch *or Half-length of the Day ; and being taken from Six hours , will leave the Seminocturnal Arch, or Half-length of the Night.*

Probl. III.

The Latitude *of the Place* 51 deg. 30 min. *and the* Declination *of the* Sun, 20 deg. *being given, to find his* Amplitude.

The Proportion is,

As the co-sine of the Latitude 38 deg. 30 min.

Is to the Radius 90 deg.

So is the sine of the Sun's Declination 20 degr.

To the sine of the Amplitude from the East or West points of the Horizon 33 degr. 20 min.

Extend the Compasses from the sine of 38 deg. 30 min (the Complement of the Latitude) to the sine of 90 deg. the same extent will reach

G 3 from

from the fine of 20 deg. (the Suns
Declination) to 33 deg. 20 min.
(the Amplitude, or) the diſtance
that the Sun riſes or ſets from the
true Eaſt or Weſt Points, towards ei-
ther the North or South.

Probl. IV.

The Latitude *of the Place*, 51 *deg*,
30 *min. and the* Declination *of the*
Sun 20 *deg. being given, to find the*
Angle *of the Sun's Poſition* at the
time of his riſing.

The Proportion is,

As the co-fine of the Declinati-
on 70 degr.

Is to the Radius 90 degr.

So is the fine of the latitude 51
degr. 30 min.

To the fine of the Angle of the
Suns Poſition at the time of his riſing.

Exrend the Compaſſes from the
fine of 70 deg. (the complement of
the

the Suns Declination) to the fine of
90 ; the fame extent will reach from
the fine of 51 deg. 30 min. the lati-
tude) to the fine of 56 deg. 29 min.
(the angle of the Sun's pofition at
the time of his rifing.)

Probl. V.

The Sun's Declination 20 *deg. and
his* Amplitude 33 *deg.* 20 *min. from
the* Eaft *or* Weft *part of the* Hori-
zon , *being given, to find the* Lati-
tude.

The Proportion is ,
As the fine of the Amplitude from
the Eaft or Weft 33 deg. 20 min.
Is to the Radius 90 deg.
So is the fine of the Declination
20 deg.
To the co-fine of the Latitude 38
degr. 30 min.

Extend the Compaffes from the
fine of 33 deg. 20 min (the Sun's
Amplitude from the Eaft or Weft)

G 4   to

to the fine of 90 deg. the fame extent will reach from the fine of 20 deg. *(*the Sun's Declination*)* to the fine of 38 deg. 30 min. *(*the complement of the Latitude , 51 deg. 30 min.*)*

Probl. VI.

The Sun's greateft Declination **23** deg. 30 *min. with his Diftance from the next* Æquinoctial Point *(*Aries *or* Libra, *59 deg.) being given, to find his* Right Afcenfion.

The Proportion is,

As the Radius 90 deg.

Is to the co-fine of the greateft Declination 66 deg. 30 min.

So is the tangent of the Sun's diftance from the next Æquinoctial point *Libra* 59 deg.

To the tangent of the Right Afcenfion 56 deg. 50 min.

Extend the Compaffes from the fine

fine of 90 deg. to the fine of 66 deg.
30 min. (the complement of the
Sun's greateft Declination ;) the
fame extent will reach from the tan-
gent of 59 deg. (the Suns diftance
from the next Æquinoctial Point)
to the tangent of 56 deg. 50 min.
(the Suns Right Afcenfion.)

Probl. VII.

The Latitude *of the Place* 51 *deg.*
30 *min. and the Suns* Declinati-
on 20 *deg. being given , to find*
at what hour the Sun will be upon the
true Eaft *or* Weft *Points.*

The Proportion is,

As the tangent of the Latitude
51 deg. 30 min.

Is to the tangent of the Suns De-
clination 20 degr.

So is the Radius 90 degr.

To the co-fine of the Hour from
Noon.

G 5.   Extend.

Extend the Compasses from the tangent of 51 deg. 30 min (the Latitude) to the tangent of 20 deg. (the Suns Declination) the same extent will reach from the sine of 90 deg. to the sine of 16 deg. 50 min. the complement of the time from Noon, that the Sun will be due East or West.

Which converted into hours and minutes, will be 4 hours and about 53 min. So that the Sun, when he hath 20 degr. of Declination, will come to the East Point at 7 min. past 7 in the Morning, and will be due West 53 min. after 4 in the Afternoon.

Probl. VIII.

Having the Latitude of the Place 51 deg. 30 min. and the Suns Declination 20 deg. given, to find what Altitude the Sun shall have when he is upon the true East or West Points.

The

The Proportion is,

As the fine of the Latitude 51 deg. 30 min.

Is to the Sine of the Declination 20 degr.

So is the Radius 90 degr.

To the Sine of the Suns Altitude being due Eaft or Weft 25 degr. 55 min.

Extend the Compaffes from the fine of 51 deg. 30 min. (the Latitude) to the fine of 20 deg. (the Declination) the fame extent will reach from the fine of 90 deg. to the fine 25 deg. 55 min. the Altitude that the Sun fhall have when he is upon the Eaft or Weft Points.

Probl. IX.

The Latitude *of the Place* 51 deg. 30 min. *and the Suns* Declination 20 deg. *being given, to find what* Altitude *the Sun fhall have at Six of the* Clock.
The

The Proportion is,

As the Radius 90 degr.

Is to the ſine of the Suns Decli-
nation 20 degr.

So is the ſine of the Latitude 51
deg. 30 min.

To the ſine of the Suns Altitude
at Six, 15 deg. 30 min.

Extend the Compaſſes from the
ſine of 90 deg. to the ſine of 20 deg.
(the Suns Declination) the ſame ex-
tent will reach from the ſine of 51
deg. 30 min. (the Latitude) to the
ſine of 15 deg. 30 min. (the Alti-
tude that the Sun ſhall have at Six of
the Clock.)

Probl. X.

The Latitude *of the Place* 51 *deg.* 30
min. and the Declination *of the
Sun* 20 *deg. being given, to find
what* Azimuth *the Sun ſhall have at
Six a Clock.*

The

The Proportion is,

As the co-fine of the Latitude 38 degr. 30 min.

Is to the Radius 90 deg.

So is the co-tangent of the Suns Declination 70 degr.

To the tangent of the Suns Azimuth counted from the North part of the Meridian 77 deg. 14 min.

Extend the Compasses from the fine of 38 deg. 30 min (the complement of the Latitude) to the fine of 90 deg. the fame extent will reach from the tangent of 70 deg. (the complement of the Suns Declination) to the tangent of 77 deg. 14 min.) the Suns Azimuth counted from the North part of the Meridian) or 12 degr. 46 min. the Azimuth from the Eaft or Weft, or 102 deg. 46 min. from the South.

Probl:

Probl. XI.

The Latitude *of the Place* 51 deg. 30 min. *the* Declination *of the Sun,* 20 deg. South, *and the Suns* Altitude 12 deg. *given, to find the Suns* Azimuth *either from the* East, North, *or* South *Points of the Ho-*rizon.

TO resolve this Problem, you must find the Complement of the Latitude, the Complement of the Altitude, and the Complement of the Declination, and add all three of them into one Sum, and take the half thereof; from which half sum substract the Complement of the Suns Declination, and note the difference; as you see here done.

Com-

Complement	Latitude	38	30
of the	Altitude	78	00
	Declinat.	110	00

Their Sum	226	30

Half Sum	113	15
Comp. Declinat. sub.	110	00

The Difference	3	15

Having found the Sum , the half Sum, and the Difference, you may work by the following

Proportion ,

1. As the Radius 90 degr.

Is to the co-sine of the Latitude, 38 deg. 30 min.

So is the co-sine of the Altitude 78 degr.

To the sine of a fourth number; which is 37 deg. 30 min.

2. As

2. As the fine of the fourth number 37 deg. 30 min.

Is to the fine of the half Sum 113 deg. 15 min.

So is the fine of the Difference 3 deg. 15 min.

To another fine, *viz.* 4 degr. 54 min.

Unto which seventh fine, if you adde the fine of 90 degr. half that Sum shall be the fine of an Arch; whose Complement being doubled is the Azimath from the North.

I.

Extend the Compasses from the fine of 90 deg. to the fine of 38 deg. 30 min. (the Complement of the Latitude) the same extent will reach from the fine of 78 deg. (the Complement of the Altitude) to the fine of 37 deg. 30 min.

II. Ex-

II.

Extend the Compasses from the Sine of 37 deg. 30 min. the number last found , to the sine of the half Sum 113 deg. 15 min. (or instead thereof , to 66 deg. 45 min. the Complement thereof to 180 deg.) the same extent will reach from the sine of 3 degr. 15 min. (the Difference) to 4 deg. 54 min.

Divide the distance between 4 deg. 54 min. and 90 deg. into two equal parts , and the Compass point will rest upon 16 deg. 48 min. the Complement whereof is 73 deg. 12 min. whose double 146 deg. 24 min. is the Suns Azimuth from the North part of the Meridian ; and if you take that from 180 deg. there will remain 33 deg. 36 min. for the Suns Azimuth from the South.

Probl,

Probl. XII.

The Latitude *of the* Place *51 deg. 30 min. the Suns* Declination *20 deg. South, and the Suns* Altitude *12 deg, given, to find the* Hour *of the Day.*

ADde the Complement of the Latitude , the Complement of the Declination , and the Complement of the Altitude , and take their Sum and half Sum , and from the half Sum fubftract the Complement of the Suns Altitude , and note the Difference.

Complement of the		
Latitude	38	30
Declination	70	00
Altitude	78	00

Sum	186	30
Half Sum	93	15
Difference	15	15

Being

Being thus prepared ,

The Proportions are,

(1.) As the Radius 90 degr.

Is to the co-fine of the Latitude 38 deg. 30 min.

So is the co-fine of the Altitude 78 degr.

To a fourth fine , *viz.* 37 degr. 30 min.

(2.) As this fourth fine of 37 deg. 30 min.

Is to the fine of the half fum 93 degr. 15 min.

So is the fine of the Difference 15 degr. 15 min.

To another fine , *viz.* to the fine of 25 deg. 33 min. Unto which fine if you adde the fine of 90 degr. (or Radius) half that fum fhall be the fine of an Arch, whofe Complement being doubled, is the hour from the Meridian 97 degr. 54 min.

I. Ex-

I.

Extend the Compasses from the fine of 90 deg. to the fine of 38 deg. 30 min. the Complement of the Latitude, the same extent will reach from 78 deg. the Complement of the Altitude, to 37 deg. 30 min.

II.

Extend the Compasses from 37 deg. 30 min. to the fine of the half fum 93 deg. 15 min. (or its Complement 86 deg. 45 min.) the same extent will reach from the fine of 15 degr. 15 min. the Difference, to the fine of 25 deg. 33 min.

Divide the distance between 25 deg. 33 min. and 90 deg. into two equal parts upon the Line, and the Compass point will rest upon 41 deg. 3 min. the Complement whereof is 48 deg. 57 min. whose double 97 deg. 54 min. is the hour from Midnight (or from the North part of the Meridian) which converted into

to

to time (by allowing 15 deg. for on
hour , and 4 deg. for one min. of
time) will be 6 hours 31 min. So
that if the time were in the Morn-
ing, the hour would be 31 min. af-
ter 6 , but if in the Evening 29 min.
after 5.

Probl. XIII.

The Declination 20 *deg.* Altitude 12
deg. and Azimuth 146 *deg. of the*
Sun , *being given , to find the hour
of the day.*

The Proportion is,

As the co-fine of the Declination
70 deg.

Is to the fine of the Azimuth 146
deg. or 34 deg.

So is the co-fine of the Altitude
78 deg.

To the fine of the hour ftom Noon
35 deg. 36 min.

Extend

Extend the Compasses from the fine of 70 deg. (the Complement of the Suns Declination) to the fine of 146 deg. (the Azimuth from the North) or to its Complement to 180 deg. *viz.* 34 deg. the same extent will reach from 78 deg. the Complement of the Suns Altitude) to the fine of 35 deg. 36 min. the time from Noon; which converted into time is 2 hours and 22 min.

Probl. XIV.

The Suns Declination 20 deg. his Altitude 12 deg. and the hour from Noon 35 deg. 36 min. being given, to find the Suns Azimuth from the North part of the Meridian.

The Proportion is,

As the co-fine of the Altitude 78 degr.

Is to the Sine of the hour from Noon 35 degr. 36 min.

So

So is the co-fine of the Suns Declination 70 deg.

To the fine of the Azimuth from the North part of the Meridian 146 deg. or 34 degr. from the South.

Extend the Compaſſes from the fine of 78 deg. (the Complement of the Altitude) to the fine of 35 deg. 36 min. (the time from Noon) the fame extent will reach from 70 deg. (the Complement of the Suns Declination) to the fine of 146 deg. (the Azimuth from the North) or 34 deg. the Azimuth from the South part of the Meridian.

Probl. XV.

The hour from Noon 35 *deg.* 36 *min. the* Latitude *of the Place* 51 *deg.* 30 *min. and the* Altitude *of the Sun* 12 *deg. being given, to find the angle of the* Suns Poſition.

The

The Proportion is,

As the co-ſine of the Suns Alti-
tude 78 deg.

Is to the ſine of the hour from
Noon 35 degr. 36 min.

So is the co-ſine of the Latitude
38 deg. 30 min.

To the ſine of the angle of the Suns
Poſition at the time of the Queſtion
(21 degr. 45 min.)

Extend the Compaſſes from 78
deg. the Complement of the Suns
Altitude (to the ſine of 35 deg. 36
min. (the time from Noon) the ſame
extent will reach from 38 deg. 30
min. (the Compliment of the Lati-
tude) to the ſine of 21 deg. 45 min.
(the angle of the Suns Poſition.)

Probl. XVI.

The Suns Altitude 12 deg. his Decli-
nation 20 deg. and Azimuth from
the North 146 deg. being given, to
find the Latitude,   The

The Proportion is,

As the Sine of the Suns Azimuth
146 deg. (or 34 deg.)

Is to the sine of the Suns distance
from the North-pole 110 deg. (or
70 deg.)

So is the sine of the angle of the
Suns position 21 deg. 45 min.

To the Complement of the Lati-
tude 38 deg. 30 min.

Extend the Compasses from 146
deg. (the Azimuth from the North,
or from 34 deg. the Azimuth from
the South) to the sine of 110 deg.
(the Suns distance from the North-
pole, or to 70 deg. its distance from
the South-pole) the same extent will
reach from 21 deg. 45 min. (the an-
gle of the Suns position) to 38 deg.
30 min. (the Complement of the
Latitude) which taken from 90 deg.
leaves 51 deg. 30 min. for the Lati-
tude it self.

H   Probl.

Probl. XVII.

The Latitude of the Place 51 deg. 30 min. the Suns Declination 20 deg. North, and the Hour from Noon 4 (viz. 60 deg.) given, to find the Suns Altitude.

The Proportions are,

(1.) **As** Radius 90 deg.

To sine 30 deg. the Complement of the hour from Noon,

So is the Co-tangent of the Latitude 38 deg. 30 min.

To a fourth Tangent, 21 deg. 41 min.

Which taken from 70 deg. the Complement of the Suns Declination, there rests 48 deg. 18 min. for a fifth sine. Then,

(2.) As the Cosine of the fourth sine 68 deg. 18 min.

To the Cosine of the fifth sine 41 deg. 42 min.

So is the fine of the Latitude 51 deg. 30 min.

To the fine of 34 deg. 5 min. the Suns Altitude at 8 in the morning, or 4 in the afternoon.

Extend the Compasses from the fine of 90 deg. to fine 30 deg. the same will reach from the tangent of 38 deg. 30 min. to the tangent of 21 deg. 41 min. which taken from 70, rests 48 deg. 18 min. — Again, Extend the Compasses from 68 degr. 18 min. to the fine of 41 deg. 42 min. the same extent will reach from the fine of 51 deg. 30 min. to the fine of 34 deg. 5 min. the Suns Altitude at 8 or 4 a clock.

The

The USE of the
PROPORTIONAL
LINES
IN
DIALLING.

CHAP. VI.

SECT. I.

Of the distinction of Plains , *upon which* Dials *are usually made.*

ALL Plains upon which *Dials* are usually made, are one of these three sorts , *viz.* either

Parallel
Perpendicular } to the Horizon,
Oblique

1. If

1. If the Plain be *Parallel* to the Horizon, it is called an *Horizontal Plain*; and of these Plains there is no variety.

2. If the Plain be *Perpendicular* to the Horizon, it is called a *Vertical Plain*, and if the face of the Plain do directly behold the true *East*, *West*, *North*, or *South* points of the Horizon, they are called the *Direct Verticals*; but if they lie between any of the four fore-mentioned *Cardinal Points*, they are then called *Vertical Plains declining* from the true *North* or *South* Points, towards either the *East* or *West*.

3. If the Plain lie *Obliquely* to the Horizon, and be neither *Horizontal* nor *Vertical*, then they are called *Reclining* or *Inclining* Plains; *Reclining* from the *Zenith*, or *Inclining* towards the *Horizon*: and of these there are several varieties in respect of their *Reclination*, *Inclination*, or *Declination*.

H 3   4. The

4. The *Declination* of a Plain is
an *Arch of the Horizon comprehended*
between the true North Point, and a
South
line issuing perpendicular from the
Plain.

5. The $\begin{Bmatrix} Reclination \\ Inclination \end{Bmatrix}$ is an Arch of
a Vertical Circle comprehended be-
tween the $\begin{Bmatrix} Zenith \\ Horizon \end{Bmatrix}$ and the Plain.

How to find out the *Quantity* of
these, and also of several other
affections belonging to several
Plains, I have handled at large
elsewhere, and shall say nothing
of them in this place; my business
here being (not to teach the
whole Art of Dialling) but to
shew the Use of the *Proportional*
Lines.

SECT. 2.

SECT. 2.

To find all the Requisites *belonging to any* Sun-Dial *by the* Proportional Lines.

I. *For an* Horizontal *Dial.*

IN the making of these Dials, there is nothing required but the height of the Pole or Stile above the Plain, and that is alwayes equal to the *Latitude* of the Place.

II. *In a Direct* Vertical North *or* South Plain.

In these Plains also there is nothing required but the height of the Pole or Stile above the Plain, and that is alwayes equal to the *Complement* of the *Latitude* of the Place.

III. *In* Vertical declining *Plains.*

In these Plains (before the Hour Lines can be drawn upon them) three

three things (beſides the *Latitude of the Plain* and the *Plains Declination*) muſt be found : *viz.*

1. *The height of the Pole above the Plain.*

2. *The diſtance of the Subſtile from the Meridian.*

3. *The Plains difference of Longitude.*

Example , In a Vertical Plain declining from the North or South 30 degr.

1. *For the height of the* Stile,

The Proportion is,

As Radius
    To the Coſine of the Latitude 38 deg. 30 min.
So is the Coſine of the Declination of the Plain 60 deg.
    To the ſine of the Stiles height 32 deg. 37 min.

Extend the Compaſſes from the
                                        ſine

fine of 90 deg, to the fine of 38 deg.
30 min. the fame extent will reach
from the fine of 60 , to the fine of
32 deg. 37 min. for the height of the
Stile.

2. *For the Subſtiles diſtance from
the Meridian.*

The Proportion is,

As Radius 90 deg.

Is to the fine of the Plains De-
clination 30 deg.

So is the Co-tangent of the Lati-
tude 38 deg. 30 min.

To the tangent of the diſtance
of the Subſtile from the Meridian,
21 deg. 41 min.

Extend the Compaſſes from 90
deg. to the fine of 30 deg. the fame
will reach from the tangent of 38
degr. 30 min. to the tangent of
21 deg. 41 min. the diſtance re-
quired.

H 5   3. *For*

3. *For the Plains difference of Longitude.*

The proportion is,

As the Cosine of the Latitude 38 deg. 30 min.
    Is to the Radius 90 degr.
    So is the sine of the Substiles distance from the Meridian 21 deg. 41 min.
    To the sine of 36 deg. 25 min.

Extend the Compasses from the sine of 38 deg. 30 min. to the sine of 90 deg. the same will reach from the sine of 21 deg. 40 min. to the sine of 36 deg. 25 min. for the Plains difference of Longitude.

IV. *In* East *or* West Reclining *or* Inclining Plains.

In these Plains (as in Upright or Vertical Decliners) three things (besides the Latitude and Reclination) must

muſt be known, before the Hour di-
ſtances can be calculated; and thoſe
are the ſame as in the other.

Example, In a direct Eaſt or Weſt
Plain, Reclining from the Zenith 35
deg. in the Latitude of 51 degr.
30 min.

1. *For the height of the Stile.*

The proportion is,

As Radius 90 deg.
    To the ſine of the Latitude 51
deg. 32 min.
    So is the ſine of the Reclination
35 deg.
    To the ſine of 26 deg. 41 min.

Extend the Compaſſes from the
ſine of 90 deg. to the ſine of 51 deg.
32 min. the ſame extent will reach
from the ſine of 35 deg. to the ſine
of 26 deg. 41 min. the height of
the Pole or Stile above the Plain.

2. *For*

2. *For the Substiles distance from the Meridian.*

The Proportion is,

As Radius 90 deg.

To the Cosine of the Reclination 55 deg.

So is the tangent of the Latitude 51 deg. 32 min.

To the tangent of 45 deg. 52 min.

Extend the Compasses from the sine of 90 deg. to the sine of 55 deg. the same extent will reach from the tangent of 51 deg. 32 min. to the tangent of 45 deg. 52 min. the Substiles distance from the Meridian.

3. *For the difference of Longitude.*

The Proportion is ,

As the sine of the Latitude 51 deg. 32 min.

To Radius 90 deg.

So

So is the sine of the Substiles distance from the Meridian 45 deg. 52 min.

To the sine of 66 deg. 27 min.

Extend the Compasses from the sine of 51 deg. 32 min. to the sine of 90 deg. the same extent will reach from the sine of 45 deg. 52 min. to rhe sine of 66 deg. 27 min. the Plains difference of Longitude.

V. *In South and North Declining*
   Reclining}
   Inclining} *Plains.*

In these Plains (besides the Latitude of the Place the Declination and {Reclination}{Inclination} of the Plain) four things must be found before the Hour-lines can be drawn , *viz.*

1. *The distance of the Meridian and Horizon.*

2. *The height of the Pole or Stile.*

3. *The*

3. The distance of the Substile and Meridian.

4. The Plains difference of Longitude.

I. In South Decliners Reclining.

Let an Example be, In a Plain declining from the South Easterly 30 degrees, and reclining from the Zenith 55 deg. in Latitude 51 deg. 32 min.

1. For the distance of the Meridian from the Horizon.

The Proportion is,

As Radius sine 90 deg.
To the sine of the Reclination 55 deg.
So is the tangent of the Declination 30 deg.
To the tangent of 25 deg. 19 min.

Extend the Compasses from 90 de.

deg. to the fine of 55 deg. the fame
will reach from the tangent of 30
deg. to the tangent of 25 deg. 19
min. the Complement whereof 64
deg. 41 min. is the diſtance of the
Meridian and Horizon.

2. *For the Stiles height above the
Subſtile.*

The Proportion is,

(1.) As Radius 90 deg.
To the fine of the diſtance of
the Meridian and Horizon 64 deg.
41 min.
So is the Co-fine of the Reclina-
tion 35 deg.
To the Sine of 31 deg. 14 min.
Which being ſubſtracted from 51
deg. 32 min. there remains 20 deg.
18 min. Then ſay,

(2.) As the fine of the diſt. of Me-
rid. and Horizon 64 deg. 41 min.
To the fine of 20 deg. 18 min.
So is the Co-fine of the Declina-
tion 60 deg. To

To the ſine of 19 deg. 25 min.

Extend the Compaſſes from ſine 90 deg. to the ſine 64 deg. 41 min. the ſame will reach from 35 deg. to the ſine of 31 deg. 14 min. which taken from the Latitude 51 deg. 32 min. leaves 20 deg. 18 min. Then, Extend the Compaſſes from 64 deg. 41 min. to ſine 20 deg. 18 min. the ſame will reach from ſine 60 deg. to the ſine of 19 deg. 25 min. for the height of the Pole or Stile above the Plain.

3. *For the diſtance of the Subſtile and Meridian.*

The Proportion is,

As the Co-tangent of the Declination 60 deg.

To the tangent of the height of the Pole above the Plain 19 deg. 25 min.

So is the ſine laſt found 31 deg. 14 min.

To

To the sine of 6 deg. 2 min.

Extend the Compasses from the tangent of 60 deg. to the tangent of 19 deg. 25 min. the same extent wil reach from the sine of 31 deg. 14 min. to the sine of 6 deg. 2 min. the Substiles distance from the Meridian.

4. *For the Plains difference of Longitude.*

The Proportion is,

As the sine of 20 deg. 18 min. (the difference of the first found Arch and the Latitude)
To sine 90 deg.
So is the sine of the Substiles distance from the Meridian 6 deg. 2 min.
To the sine of 17 deg. 38 min.

Extend the Compasses from the sine of 20 deg. 18 min. to sine 90 deg. the same extent will reach from the

the fine of 6 deg. 2 min. to the fine
of 17 deg 38 min. the Plains diffe-
rence of Longitude.

II. *In* North Decliners Reclining.

In thefe Plains (as in the South
Decliners Reclining) the fame four
things muft be found before the
Hour diftances can be obtained:
Wherefore,

Let our Example be of a North
Plain declining Wefterly 60 deg.
and Reclining 54 deg.

1. For the diftance of the Meridi-
an from the Horizon.

The Proportion is,
As Radius 90 deg.

To the fine of Reclination 54
deg.

So is the tangent of Declination
60 deg.

To the tangent of 54 deg. 29
min. which taken from 90 degr.
leaves 35 deg. 31 min.

Extend

Extend the Compasses from fine 90 deg. to fine 54 deg. the fame will reach from the tangent of 60 degr. to the tangent of 54 degr. 29 min. whofe Complement to 90 deg. is 35 deg. 31 min. the diftance of the Meridian and Horizon.

2. *For the Stiles height above the Subftile.*

The Proportion is,

(1.) As the fine of the Declination 60 deg.

To fine 90 deg.

So is the Co-fine of the Meridians diftance from the Horizon, 54 deg. 29 min.

To the fine of 70 deg. 2 min. for a firft arch. —— To which adde 38 deg. 28 min. the Complement of the Latitude, the fum will be 108 deg. 30 min. whofe Complement to 180 deg. is 71 deg. 30 min. for a fecond Arch.

(2.) As

(2) As the sine of the first Arch 70 deg. 2 min.

To the Sine of the Reclination 54 deg.

So is the Sine of the last found Arch 71 deg. 30 min.

To the sine of 54 deg. 43 min.

Extend the Compasses from the sine of 60 deg. to the sine of 90 deg. the same will reach from the sine of 54 deg. 29 min. to the sine of 70 deg. 2 min. —— To which 38 deg. 32 min. being added, makes 108 deg. 30 min. whose Complement to 180 deg. is 71 deg. 30 min. Then —— Extend the Compasses from sine 70 deg. the first Arch, to sine 54 deg. (the Reclination) the same extent will reach from the sine of the second found arch 71 deg. 30 min. to sine 54 deg. 43 min. for the height of the Stile.

3. *For*

3. For the *Substiles distance from* the *Meridian*.

The Proportion is,

As the tangent of the Reclination 54 deg.

Is to the sine of 54 deg. 29 min. (the first found arch)

So is the tangent of the Stiles height 54 deg. 43 min.

To the sine of 56 deg. 42 min.

Extend the Compasses from the tangent of 54 deg. to the sine of 54 deg. 29 min. the same will reach from the tangent of 54 deg. 43 min. to the sine of 56 deg. 42 min. Which 56 deg. 42 min. (or 123 deg. 18 min. the Complement thereof to 180 deg.) is the Substiles distance from the Meridian, according as you will account it from North or South.

4. *For*

4. *For the Plains difference of Longitude.*

The Proportion is,

As the sine of the Stiles height 54 deg. 43 min.

To the sine of 90 deg.

So is the tangent of the distance of the Substile and Meridian 56 deg. 42 min.

To the tangent of 61 deg. 48 min.

Extend the Compasses from the sine of 54 deg. 43 min. to the sine of 90 deg. the same will reach from the tangent of 56 degr. 42 min. to the tangent of 61 deg. 48 min. the Complement of the Plains difference of Longitude from the North, or its Complement to 180 deg. counted from the South.

SECT. 3.

SECT. 3.

*Of Direct North and South
Reclining Plains.*

IN Direct North and South Reclining Plains there is nothing required before the Hour distances can be calculated, but the height of the Pole or Stile above these Plains; and that may be easily thus found.

1. *South Recliners.*

If the Reclination of the Plain be $\begin{Bmatrix} less \\ more \end{Bmatrix}$ then the Complement of the Latitude $\begin{Bmatrix} substract \\ adde \end{Bmatrix}$ the Reclination $\begin{Bmatrix} from \\ to \end{Bmatrix}$ the Complement of the Latitude, and the $\begin{Bmatrix} Remainer \\ Sum \end{Bmatrix}$ will be the height of the Pole or Stile above the Plain.

2. *Of*

2. Of North Recliners.

The Complement of the Latitude
and Reclination added together,
gives the height of the Pole or Stile
above the Plain: — But if this sum
do exceed 90 deg. substract it from
180 deg. and the remainer shall be
the height of the Pole or Stile above
the Reclining Plain.

SECT. IV.

*To calculate the Hour distances up-
on all sorts of Plains.*

UPon all *Horizontal, Direct North*
and *South* Plains, whether *Erect*
or *Reclining*, the *Stile* stands upon
12 *of the Clock*; for these Plains
have no difference of Longitude;
and therefore the *Substile* and *Hour-
line of 12* are the same; and the E-
quinoctial distance of each hour
from 12 is 15 deg.

In all other *Plains*, as *Erect Decliners*, and *North and South Recliners declining*, which have *difference of Longitude*, the Plains difference of Longitude muſt be reduced into Time, allowing 15 deg. for an hour, *i. e.* one degree for 4 min. of time; and ſo having found the Equinoctial diſtance of the two hours on either ſide of the Subſtile, the Equinoctial diſtances for all the other hours are eaſily found, by the continual addition of 15 degrees for one hour: And then the proportion will be,

As the ſine of 90 deg.

To the ſine of the height of the Pole or Stile above any Plain whatſoever it be;

So is the tangent of the Equinoctial diſtance of any hour from the Meridian of any Direct North or South Plain, whether Erect or Re-

l   clining,

clining: —— But from the Substile
of all other Plains.

To the tangent of the true
hours distance upon the Plain, from
the Meridian or Substile.

This Analogy is general for all
sorts of Plains, and so let
this suffice for DIALLING
in this place.

The

The USE of the
PROPORTIONAL
LINES
IN
GEOGRAPHY.

CHAP. VII.

Probl. 1.

Two Places which differ only in La-
titude, to find their Distance.

1. IF both the Places lie under
one and the same Meridian,
and on one and the same side
of the Æquinoctial, substract
the lesser Latitude from the greater,

and the Difference converted into Miles (by allowing 60 Miles to one degree) ſhall give you the diſtance.

Example, *London* and *Ribadio* lie both under one Meridian, but differ in Latitude, for *London* hath 51 deg. 30 min. and *Ribadio* Latitude 43 deg. both North; the difference of Latitude is 8 degr. 30 min. which being turned into miles makes 510 miles.

2. If the two places lie under one and the ſame Meridian, but one on the North, and the other on the South ſide of the Æquinoctial, add both the Latitudes together, the ſum is the diſtance.

Example, *London* and the Iſland *Triſtan Dacunhu* lie both under one Meridian, but *London* hath 51 deg. 30 min. North Latitude, and the Iſland hath 34 deg. South Latitude; their ſum is 85 degr. 30 min. which

converted into miles (by dividing
the degrees by 60, and allowing for
every minute one mile) makes 5130
miles ; and such is the distance of
London and the Island *Tristan Da-*
cunha.

Probl. 2.

Two places which differ only in Longi-
tude, to find their Distance.

1. THe two places may lie both
under the Æquinoctial, and
have no Latitude ; in this Case the
difference of their Longitudes (if it
be less than 180 degr.) reduced in-
to miles is their Distance ; but if
their difference exceed 180 degr.
take it out of 360 degr. the remain-
ing degrees turned into miles will be
the Distance of the two Places.

Example , The Island *Sumatra*
and the Island of St. *Thoma* lie both
under the Æquinoctial , the Island

I 3   of

of Sr. *Thoma* having 33 deg. 10 min.
of Longitude, and the Island *Suma-*
tra 137 degr. 10 min. The lesser
Longitude taken from the greater
leaves 104 deg. 0 min. which con-
verted into miles is 6240 ; and that
is the distance of the two Islands.

2· But if the two places differ on-
ly in Longitude , and lie not under
the Æquinoctial, but under some o-
ther intermediate Parallel of Lati-
tude : As *Constantinople* and *Compo-*
stella , both in the Latitude of 47
degr. but differing in Longitude 43
deg. 15 min. then

The Proportion is,

As the Radius 90 degr.
   Is to the Co-sine of the com-
mon Latitude 47 degr.
So is the sine of half the difference
of Longitude 21 deg. 37 min.
   To the sine of half their Di-
stance 15 degr. 38 min.

Extend

Extend the Compasses from the
sine of 90 deg. to 47 deg. (the Com-
plement of the Common Latitude)
the same extent will reach from the
sine of 21 deg. 37 min. (half the
difference of Longitude) to the sine
of 15 deg. 38 min. half the distance
of the two places.

The double whereof is 31 deg.
16 min. or 1876 miles.

Probl. 3.

*Two places differing both in Longi-
tude and Latitude being proposed,
to find their distance.*

1. ONe of the places may lie under
the Æquinoctial, and have
no Latitude, and the other under
some Parallel of Latitude between
the Æquinoctial and one of the Poles.
For finding the distance of places
that are so situate, as St. *Thome
Island* under the Æquinoctial in 33
deg. 10 min. Longitude, and *Lon-*
don

don in 51 deg. 30 min. North Latitude, and Longitude 20 deg. the difference of Longitude being 13 deg. 10 min.

The Proportion is,

As the Radius 90 deg.

Is to the Co-sine of the difference of Longitude 76 degrees 50 min.

So is the Co-sine of the Latitude given 38 deg. 30 min.

To the Co-sine of the distance required, 52 degr. 41 min.

Extend the Compasses from the sine of 90 degr. to the sine of 76 degr. 50 min. (the Complement of the difference of Longitude) the same extent will reach from 38 deg. 30 min. (the Complement of the given Latitude) to 37 degr. 19 min. (the complement of the distance of the places) that is 52 deg. 41 min. which in miles is 3161.

2. If

2. If both the Places proposed shall be without the Æquinoctial, but on one side, either both towards the North, or both towards the South , as *London* , in Longitude 20 deg. and Latitude North 51 deg. 30 min. and *Jerusalem* in Longitude 66 deg. and Latitude North 31 deg. 40 min. the difference of Longitude being 46 deg. use this proportion :

(1.) As Radius 90 deg.

Is to the sine of 44 deg. the complement of the difference of Longitude ,

So is the tangent of the complement of the greater Latitude 38 deg. 30 min.

To the tangent of 28 deg. 55 min. a fourth Term.

This 28 deg. 55 min. being taken from the complement of the lesser Latitude 58 deg. 20 min. there remains 29 deg. 24 min. Then,

(2.) As

(2.) As the fine of 28 deg. 55 min. the fourth Term,

Is to the Co-fine of the greater Latitude 38 deg. 30 min.

So is the fine of the Remainer 29 deg. 24 min.

To the fine of 39 deg. 11 min. the diftance.

(1.) Extend the Compaffes from the fine of 90 deg. to the fine of 44 deg. (the complement of the difference of Longitude) the fame extent will reach from the tangent of 38 deg. 30 min. (the complement of the Latitude of *London*) to the tangent of 28 deg. 56 min. for a fourth number ; which taken from the complement of the leffer Latitude *Jerufalem* 58 deg. 20 min. leaves 29 deg. 24 min.

Again,

(2.) Extend the Compaffes from the fine of 28 deg. 55 min. the fourth number,

number , to the fine of 38 deg. 30 (the complement of the greater Latitude *London*) the fame extent will reach from 29 deg. 24 min. (the former remainer) to the fine of 39 deg. 11 min. for the diftance of the two places; which in miles is 2331.

3. The two places propounded may be fo fituate , that one may be in North Latitude , the other in South, and be under different Longitudes : As fuppofe the places to have

deg. min.

Latitude N 50 0
Latitude S 32 25
And differ in Longitude 70 deg. fay,

(1.) As Radius

To the fine of 20 deg. the complement of the difference in Longitude;

So is the tangent of the greater Latitude 50 degr.

To the tangent of 16 deg. 1 min.

Take

Take this fourth Term 16 deg. 1 min. from 57 deg. 35 min. the complement of the leſſer Latitude, and the remainer will be 41 deg. 34 min.

And ſay again,

(2.) As the ſine of 73 deg. 59 min. (the complement of the fourth Term before found)

To 48 deg. 26 min. (the complement of the Remainer,)

So is the ſine of 50 deg. (the greater Latitude,)

To the ſine of 36 deg. 36 min. (whoſe complement 53 deg. 24 min.) is the diſtance, which in miles is 3205.

The

The USE of the PROPORTIONAL LINES IN NAVIGATION.

CHAP. VIII.

THe principal Problems in use with Mariners in their Navigations (besides those of Astronomy and Geography in the foregoing Chapters) are such as concern *Longitude*, *Latitude*, *Rumb*, and *Distance*, a few of which I shall shew how to perform by the *Proportional Lines*.

<div align="right">Example</div>

Examples in Figure I.

In which Figure,

C A reprefent the Meridian, *C* North and *A* South.

B A, A Parallel of Latitude, *B* Weft and *A* Eaft.

C B, A Rumb 53 deg. 7 min. diftant from the Meridian Weftward, which Rumb is N. W. 8 deg. 7 min. Wefterly from *C*. and N. E. by N. 19 min. Eafterly.

And fo

C B Is the Courfe or Rumb.

C A The difference of Latitude, and

B A The departure from your firft Meridian.

Probl. I.

Probl. 1.

The course and distance given, to find the difference of Latitude and departure from your first Meridian.

SAiling from C 225 min the Course or Rumb is N W 8 deg. 7 min. Westerly (that is 53 deg. 7 min. from the Meridian) I demand how much I have altered my Latitude, and how far I have departed from my first Meridian.

The Proportion is,

As Radius 90 deg.

Is to the distance sailed 225 min.

So is the sine of the Rumb 53 deg. 7 min.

To 180 the departure from your first Meridian.

And

And

So is the complement of the Rumb 36 deg. 53 min.

To 135 min. the difference of Latitude 1.

Extend the Compasses from the fine of 90 deg. to 225, the fame extent will reach from 53 deg. 7 min. the Rumb, to 180 min. for your departure: —— And also the fame extent will reach from 36 deg. 53 min. the complement of the Rumb, to 135 min. for the difference of Latitude.

Probl. 2.

The courfe and difference of Latitude given, to find the diftance failed, and the departure from your firft Meridian.

LEt the Courfe be N. W. 8 deg. 7 min. Wefterly (or 53 deg. 7 min. from the Meridian) as before; the diffe-

difference of Latitude 135 min. and let the distance sailed CB , and the departure B A be required.

The Proportion is,

As the Co-sine of the Course 36. deg. 53 min.

Is to 135 min. the difference of Latitude ;

So is Radius 90 deg.

To 225 min. the distance sailed.

And

So is the sine of the Rumb 53 deg. 7 min.

To 180 min. the departure.

Extend the Compasses from 36 deg. 53 min. to 135 , the same extent will reach from 90 deg. to 225 for the distance sailed : —— And from 53 deg. 7 min. to 180 min. the departure from your Meridian,

Probl. 3.

Probl. 3.

The course and departure being given, to find the distance sailed and the difference of Latitude.

LEt the course be N. W. 8 deg. 7 min. Westerly (or 53 deg. 7 min. from the Meridian) and the departure from the Meridian 180 min. and let the distance sailed and the difference of Latitude be required.

The proportion is ,

As the sine of the course 53 dsg. 7 min.
Is to the departure 180 min.
So is Radius 90 degr.
To 225 the distance sailed.

And

So is the complement of the course 36 deg. 53 min.
To 135 min. the difference of Latitude.

Extend

Extend the Compasses from the
sine of 53 deg. 7 min. to 180 min.
the same extent will reach from the
sine of 90 deg. to 225 min. the di-
stance sailed ; and the same extent
also will reach from 36 deg. 53 min.
the complement of the courf, to 135
min. the difference of Latitude.

Probl. 4.

The difference of Latitude and distance
sailed, given , to find the course and
departure from the Meridian.

A Ship sails between the North
and the West 225 min. so long
till she hath altered her Latitude
135 min. I demand what course the
Ship hath made , and also how far
she hath departed from her first Me-
ridian.

The Proportion is,

As the sine of 90 degr.

Is to 225 m. the distance sailed,
So

So is 135 min. the difference of Latitude,

To 36 deg. 53 min. the complement of the course that the Ship sailed.

And

So is the sine of 53 deg. 7 min.
To 180 min. the departure.

Extend the Compasses from 225 min. to the sine of 90 deg. the same extent will reach from 135 min. to 36 deg. 53 min. whose complement 53 deg. 7 min. is the course. ——— And the same extent also will reach from 53 deg. 7 min. to 180 min. the Ships departure from the first Meridian.

Probl. 4.

Probl. 4.

The distance and departure given, to find the course and difference of Latitude.

THE distance sailed is 225 min. and the departure is 180 min. I demand the course and difference of the Latitude : For which

The proportion is,

As 225 the distance sailed,
 Is to the sine of 90 deg.
So is 180 the departure,
 To the sine of 53 deg. 7 min. the course.

And

So is the sine of 36 deg. 53 min. the Complement of the Course,
 To 135 min. the difference of Latitude.

Extend the Compasses from 225 min. the distance, to 90 deg. the
<div align="right">same</div>

same extent will reach from 180
min. the difference, to 53 deg. 7
min. the courfe, which is N. W. 8
deg. 7 min. Wefterly ―― And the
fame extent will reach from 36 deg.
53 min. the complement of the
courfe, to 135 min. the difference
of Latitude.

Probl. 5.

*The diffeeence of Latitude and depar-
ture given, to find the courfe and
diftance.*

THe difference of Latitude is 135
min. and the departure is 180
min. the Rumb and Diftance is re-
quired:

The Proportion is,

As 135 min. the difference of La-
titude,

Is to Radius (or Tangent of 45
degr.)

So

So is 180 min. the diſtance,

To the tangent of 53 deg. 7 min. the courſe.

And

So is the tangent of 45 deg.
To 225 min. the diſtance ſailed.

Extend the Compaſſes from 135 min. the difference of Latitude, to the tangent of 45 deg. the ſame extent will reach from 180 min. the diſtance, to the tangent of 53 deg. 7 min. or N. W. 8 deg. 7 min. Weſterly for the courſe. —— And the ſame extent alſo will reach from the tangent of 45 deg. to 225 min. diſtance ſailed.

FINIS.

THE LINE

OF *Petiver*

PROPORTION,

Commonly called

GUNTER'S LINE,

Made Easie.

A SECOND PART.

With the addition of other Lines, which
may conveniently be put upon a *Two-foot Rule*,
and their *USES* Exemplified, In

Arithmetick,	*Astronomy,*
Geometry,	*Dialling,*
Military Affairs,	*Geography,*
Trigonometry,	*Navigation, &c.*

By WIL. LEYBOURN *Philom.*

To which is added a

SUPPLEMENT,

Containing the Description and some
Uses, of a convenient Two-foot
JOYNT-RULE:

Upon which are inscribed divers Lines and Scales,
suitable to all sort of Artificers occasions.

By JOHN BROWN.

To the

R E A D E R.

THe *Good Acceptance which the former Part of this* BOOK *hath* received in the World (which was entituled, The Use of the Line of Proportion (or Numbers) *commonly called* Gunter's Line made easie) *hath a-nimated me to write some o-ther* Precepts, *and to adde some other* Proportional Lines of Mr. Gunter's *first contrivance from*

A 2 *his*

To the Reader.

his Logarithmical Tables *of* Artificial Sines *and* Tangents *upon* a Strait Ruler.

In the First Part *I have principally applied the* Line *of* Numbers *to such kind of* Mensurations *as are of daily use amongst* Workmen , *as in the* Mensuration *of* Board, Glass, Timber , Stone , Brick-work, Tiling , Painting , Paving, Plaistering, Wainscotting , &c *of all which (and some other* Mensurations *) I have given there sufficient Rules and Examples. Wherefore I shall (in this* Second Part *) omit to say any thing of such matters or things as I have at large handled therein ; although all the*

Work

Work in that Book contained may be performed upon one of the Lines which is upon this Ruler, namely, by the Line of Numbers of two Radiusses; but shall principally discourse, or treat, of the Uses of such other Proportional Lines as are inscribed upon this Ruler, as now contrived: And yet I will not forbear to shew how to perform many Problems in the Former Part by this Ruler also; but they shall only be such, which by the Lines (as they are now disposed) may be wrought with less Trouble, more Speed, and the same Exactness; and many, which there (by the Single Line) required greatest trouble in their per-

A 3   formance,

To the Reader.

formance, *may be here done with the greatest* ease; *nay, many (and those the most difficult) by inspection only, not medling with any other; My principal aim in this* Second Part *being to shew such other Uses of the Common (or General) Line (viz. the* Line of Numbers*) together with such other Proportional Lines or Scales upon this Ruler inscribed, in the solution of the most useful and necessary Problems in* Arithmetick, Geometry, Astronomy, Geography, Navigation, Dialling, Trigonometry, *and several other of the* Mathematical Sciences, *as shall render it a most absolute and necessary Concometant, not only*

for

for *Artificers* , *but for all sorts or degrees of Men* , *of what quality soever* , *that are any wayes inclinable to* , *or delighted in* Mathematical Practices.

And in order thereunto I have under apt *Heads and distinct Titles* (*and not miscellaneously*) *given variety of* Problems *and* Examples *in all the above-mentioned Sciences.*

I *shall not say more to induce you to the perusal of these Tractates* , *but commend you to the* Practice *of what is herein contained* ; *and* (*besides the delight you will take therein*, *the benefit and profit you may*

re-

receive thereby) will be suf-
ficient motives to induce you to
their perusal.

And now let me acquaint thee
Reader, that unto this Second
Part there is added a Supple-
ment, *containing the* Descrip-
tion, *and some* Uses *(and those*
not a few) of a convenient Two-
foot Joynt-Rule.

Thus have I given you a short
Account of what is contained
both in this Second Part *and in*
the Supplement ; *both which*
I commend unto thee, wishing
thee good success in thy perusal
and practice of them ; and in
a short time thou mayest expect
some other Treatises of this kind,
and

To the Reader.

and of other Parts of the Mathematicks also (some of them being almost ready for the Press:) from him who wishes thy welfare and the Advancement of Knowledge in the Common-wealth wherein he lives.

London,
May 21. 1677.

OF
PROPORTION
Made EASIE.

A SECOND PART.

CHAP. I.

The description of the RULER, and the manner how the several Lines upon it are to be disposed.

THe Ruler may be made either of Brass, Wood or Ivory, and it may be a streight Ruler of two Foot long or more, at pleasure; or it may be in a streight

B   Rule

Rule or Scale but of one foot lon H.
but then some of the lines will be
ry short, and the Division on the
too small; Or Thirdly (and best
all) upon a Two-foot-Joynt-Ru
which opened will be the same a
streight Rule of two-foot long.

The Lines upon the Ruler are
Number Eight, besides Scales of
qual parts, and of Chords, whi
may be upon the edges of the R
ler. But upon the flat of the Ru
(as I said before) Eight Scales
Lines.

    I. The first, and uppermost is
single line of Numbers, containi
the whole length (or very near)
the Rule, divided first into ten u
equal parts, and those again fi
divided into ten, so often as qua
tity will permit, according to t
usual manner of dividing of su
Lines.

    II. Ne

II. Next under this Line (and facing of it,) are three lines of Numbers, all of equal length, and all three of them together, are of equal length to the first single line.

III. The third Scale is a Line of Numbers broken, having One in the middle thereof, and broken off at either end of the Rule, at 31 and 62 hundred part,

IV. Underneath this broken Line (and facing of it) is the common line of Numbers of two *Radiusses.*

These Four fore-mentioned Lines, serve to *Extract* the *Square* and *Cube Roots* by Inspection, without the use of Compasses, and for other Uses also, as shall hereafter be made manifest.

V. The fifth Line is a line of *Artificial Sines*, divided into 90 unequal parts, and subdivided. And

III. The third Scale is a Line of Numbers broken, having One in the middle thereof, and broken off at either end of the Rule, at 31 and 62 hundred part,

IV. Underneath this broken Line (and facing of it) is the common line of Numbers of two *Radiusses.*

These Four fore-mentioned Lines, serve to *Extract* the *Square* and *Cube Roots* by Inspection, without the use of Compasses, and for other Uses also, as shall hereafter be made manifest.

V. The fifth Line is a line of *Artificial Sines*, divided into 90 unequal parts, and subdivided. And

B 2　　　　VI. Is

VI. Is a line of *Artificial Tangents*
numbered unequally to 45 Degrees,
and back again towards 90, so far
as the Ruler will permit.

These two Lines of *Sines* and *Tan-
gents*, are both of them of one
Length or *Radius*, and are to be
used with the fourth line of Num-
bers of 2 *Radiusses*.

VII. The seventh Scale is a Line
of *Artificial Sines*, having 90 deg.
in the middle of the Line, and then
the Divisions are continued up be-
yond 90 deg. to the end of the Ru-
ler, ending at 84 deg. 10 m. or ra-
ther at 174 deg. 10 m.

VIII. The eight Scale is a line of
Artificial Tangents, which faceth the
former line of Sines, having the *Ra-
dius* (or 45 deg.) in the middle of
the Line, against 90 deg. of the
Sines, and is continued up above
45 deg. to the end of the Ruler
                                    where

where it terminates at 84 deg. 10 m.
as the Sines do, and this avoids back-
ward counting.

These two laſt lines of *Sines* and
Tangents (being both of the ſame
Radius) are to be uſed with the
Fourth Line of *Numbers* of two
Radiuſſes, and are of good uſe in
the ſolution of *Spherical Triangles*,
where Obtuſe Angles are ingre-
dient in the Queſtion : And alſo
when the *Tangent* given or requi-
red, exceeds 45 degrees.

I ſhall ſay no more concerning
the Lines upon the Ruler, for every
man being at liberty to inſert ſuch
other as his particular occaſion ſhall
require, as *Chords*, *Equal parts*, a
Meridian-line, and ſuch like: In the
Figure they are diſpoſed in this
Order.

The

✿✿✿✿✿✿✿✿✿✿✿✿✿✿✿

The USE of the

PROPORTIONAL

LINES

IN

ARITHMETICK

CHAP. II.

TO pass by *Numeration*, *Multi-
plication*, *Division*, the *Golden
Rules* both *Direct* and *Reverse*, and
also *Duplicated* and *Triplicated Pro-
portions*, they being sufficiently trea-
ted of in the Seven first Chapters of
the First part, I shall proceed to
the work of the Ninth Chapter,
which is

SEC

SECTION I.

To Extract the Square Root *by the Lines.*

THe Rule delivered for the Extraction of the Square Root in the Ninth Chapter, is, [*Divide the space between* 1 *, and the number whose Root is to be Extracted into two equal parts, and the middle point shall fall upon the Root required.*] So the root of 36 being required, if you divide the space between 1 and 36 into two equal parts, the Compass point will rest upon 6, which is the root of 36.——— Also the second *Example* of that Ninth Chapter requires the root of 256, the distance between 1 and 256 being divided into two equal parts, the Compasses will fall upon 16, the root of 256.

This is the way there prescribed, and is the only way to perform

that

As 100 : to 78,54 ::
So is 768, to 603,19

Extend the Compasses from 100,
to 78,54 (a fixed Area) the same will
reach from 768 (the Rectangled Fi-
gure made of the two Diameters)
to 603,19, the Area of the Ellipsis.

Question 16.

*To find the Diameter of a Circle
whose Area shall be equal to the Area
of the former Ellipsis?*

Upon the Line of Numbers of two
Radiusses, open the Compasses from
24 to 32 the two Diameters of the
Ellipsis, that distance applied to the
single Line, will reach from 24 the
lesser Diameter, to 27,71 the Dia-
meter of a Circle, whose Area shall
be equal to the Area of the Ellipsis.

Question

Quest. 17.

The Chord Line 60,8 , *and Altitude* 14, *of the Segment of any Circle, being known, to find out the other parts of the Circle and the Area of the Circle?*

1. Extend the Compasses from 1 to 30,4 , half the Chord of the Arch , and that distance again repeated from 30,4 , will reach to 924,16, the square of half the Arch Line.

2. Extend the Compasses from 14 (the Altitude of the Arch) to 1, the same will reach from 924,16, to 66, to which if you adde 14 the Altitude of the Arch, the sum will be 80, for the Diameter of the Circle , the half whereof 40 , is the Radius of the Circle.

3. Adde half the Segments Chord 30,4 , and the Segments Altitude 14, together, they make 44,4, whose

D   Square

Square Root is 6,67 *fere*, and is the
length of the Chord of half the Seg-
ments Arch.

SECT. II.

Of Solid Measures.

Quest. 1.

*If a piece of Square Timber be 15
inches broad,* 22 *inches deep, and 12
foot long: how many solid foot are con-
tained therein?*

Extend the Compasses upon the
Line of two Radiuses, from 15 in-
ches the breadth, to 22 in the depth,
that extent shall reach from 15 up-
on the single Line, to 18¼ inches
for the true square at the end, then
your proportion will be

As 12 inches,
    To the inches square 18¼,

So is the length in feet 20,

To a fourth ; and that fourth to 46 foot.

Extend the Compasses from 12 to 18¼, the same will reach from 20 the length , at twice turning the Compasses, to 46 , the quantity of feet contained in the whole piece.

Or in Foot Measure.

Extend the Compasses from 1,25, the breadth, to 1,84 the depth, upon the Line of two Radiusses, that distance applied to the single line, shall reach from 1, 25 to 1,52.

Again , Extend the Compasses from 1 to 1,52 , the same extent shall reach from 20 , at twice turning of the Compasses , to 46 the content of the Piece in Feet.

D 2 *Quest.*

Question 2.

*If a Piece of Tapering Timber be
2,2 foot, and 0,41 foot at one end,
and 1,32 foot, and 1,75 foot at the
other end, and 12 foot long; how ma-
ny solid foot is contained in this Piece
of Timber?*

1. Upon the Line of two Radi-
usses, take the distance between 1,
and 0,41, the same extent will reach
downwards from 2,2, to 0,90, for
the content of the Base at the little
end.

2. Upon the same Line take the
distance between 1 and 1,32, the
same extent will reach from 1,75,
to 2,31, the content of the greater
end.

3. Extend the Compasses from 8, the
1, downwards to 90, the Area of
the lesser Base, the same extent will
reach from 2,31, the Area of the
greater Base, to 2,08, the product

of the two ends multiplied toge-
ther, the Square Root where-
of is 1,44 : Add this Root
and the two Bases together,
their sum is 4,65. Then again,

0,90
2,31
1,44
————
4,65

Extend the Compasses from
1 to 4 (which is one third of
the length of the piece) the same
extent shall reach from 4,65, to
18,60 the true content of the whole
piece.

Question 3.

If a Cube, whose side is **12** *inches,
doth contain* 1728 *Cubical inches, how
many Cubical inches shall a Cube con-
tain, whose side is* 8 *inches?*

Out of one of the Lines of 3 Ra-
diusses take the distance from 12 to
8, the difference of sides, that same
distance applied to the single Line,
shall reach from 1728 downwards
to 512, the solid inches in a Cube,
whose side is 8 inches.

D 3   Quest.

Question 4.

If a Bullet, or Sphear, being 6 inches Diameter, do weigh 30 l. what shall a Sphear of the same metal weigh, whose Diameter is 7 inches?

Take the distance between 6 and 7 out of the Line of 3 Radiusses, the same extent applied to the single line, will reach from 30, to 47,7, and so much will a Bullet of the same metal weigh, whose diameter is 7 inches.

Question 5.

If a Ship of 300 Tun burthen, be 75 foot by the Keel, what burthen shall that Ship be, whose Keel is 100 foot?

The distance between 75 and 100 being taken out of the Line of three Radiusses, applied to the single Line, will reach from 300 Tun, to 710 the burthen of that Ship, whose Keel is 100 foot.

Quƒtion 6.

If a Ship of 300 Tun, be 29,5 foot in the Beam, what shall the Length of the Beam of that Ship be, whose burthen is 713 Tun?

Out of the single Line, take the distance between 300 and 713, that same extent applied to the Line of three Radiusses, shall reach from 29,5, to 39,35, for the length of the Beam of a Ship, whose burthen shall be 713 Tun.

Quƒtion 7.

If a Ship of 300 Tun be 13 foot in Hld, what shall that Ship be in Hld, whose burthen is 713 Tun?

Out of the single Line, take the distance between 300 and 713, that distance applied to the Line of three Radiusses, shall reach from 13, to 17,35, and so much shall that Ship be

D +

be in Hold, whose burthen is 713
Tun.

Question 8.

*If a Brass Piece of Ordnance, whose
Diameter is 11,5 inches, do weigh 1900
pounds, what shall another Piece weigh,
(of the same shape) whose Diameter
is 8,75 inches?*

The Extent between 11,5 and 8,75
taken upon the broken Line of three
Radiusses, will reach upon the single
Line, from 1900 to 837; and so
much shall that Piece weigh, whose
Diameter at Bore is 8,75.

The USE of the
PROPORTIONAL
LINES
IN
Military Affairs.

CHAP. IV.

SECT. I.

Quest. I.

How to order any number of Soldiers into a Square Battail; so that there shall be as many in Rank as in File?

LET it be required to make a Square Battail of 2704 men, so that there be as many in Rank as in File.

For

Forasmuch as the number of Souldiers do confist of an even number of Figures, feek that number 2704, in the firft Radius of the Double Line of Numbers, and right againft it in the Broken Line, you fhall find 52, and fo many muft be in Rank, and as many in File : And thefe Souldiers, if they be imbattelled at Order (which is 3 Foot in Rank and as much in File) then will they occupy 24336 fquare foot of Ground; which by the Lines you may thus find.

Extend the Compaffes from 1 to 3 (the diftance in Rank and File) the fame extent will reach from 52 to 156; find 156 upon the Broken Line, and againft it in the Double Line you fhall find 24336, the Ground that thefe Souldiers will occupy, being at their Order of 3 foot.

Queft.

Quest. 2.

Any number of men being proposed, to place them in Battalia, in such order that there may be as many more in Rank as in File, and that they may stand at Close Order, which is 1½ foot?

LEt the number given be 2602, count the half thereof 1301, upon the Double Line, and against it you shall find in the Broken Line 36, which is the depth in File, and then there must be 72 in Rank, which is twice 36.

Now for the Ground that these will occupy, being at Close Order,

As 1 : is to 1,5 : : so is 36 : to 54: and so is 72 to 1080.

Extend the Compasses from 1 to 1,5, the same extent will reach from 36 (the depth of men in File) to 54 the side of the Ground. ---- Again, the

the same extent will reach from 72 (the Front of the men in Rank, to 1080 the length of the Ground. — Then for the Area,

Extend the Compasses from 1 to 1080 ; the same extent will reach from 54 to 58320 , and so many square foot of Ground will these 2602 men occupy at Close Order.

Quest. 3.

Any number of men being proposed to be put in Battalia, and a certain number named to be either in Rank or File, to find the other number?

LEt it be required to place 872 men in Battalia, so that there shall be 8 in File, how many must there be in Rank ; or how many Files must there be ?

The Proportion to work this is,

As 8, the depth in File,
    Is to 872, the number of Soul-
        diers ,   So

So is 1, to 109 the number of men in Rank.

Extend the Compasses from 3, to 87, the same extent (the same way) will reach from 1, to 109.

Quest. 4.

Any number of Souldiers being given, together with their distance in Rank and File, to order them into a Square Battal of Ground?

LEt the number of Souldiers given be 3000, their distance in File 7 foot, and in Rank 3 foot;

The Proportion holds,

As 7: to 3 : : so is 3000: to 1286.

Extend the Compasses from 7, downwards to 3, the same extent will reach from 3000, downwards to 1286.

Seek 1286 in the first Radius of the Broken Line, and just against it you

you ſhall find 35,7 , the number of
men to be placed in File — 35 men
is too little and 36 men will be too
much ; but men are not to be di-
vided in parts.

Queſt. 5.

How to order any number of ſouldiers
into Rank *and* File *, ſo, that their*
diſtance in Rank ſhall be to the di-
ſtance in File , in ſuch proportion as
any two numbers given are ?

IF 3000 ſouldiers were to be or-
dered in Rank and File , ſo that
the diſtance between Rank and Rank
ſhall be in proportion to the di-
ſtance between File and File , as 5
is to 9 (that is) if the men in File
ſtand 9 foot aſunder , the men in
Rank ſhall ſtand 5 foot aſunder.

The Proportion is ,

As 5 : to 9 :: ſo is 3000 : to 5400.

Extend the Compaſſes from 5 to
9,

9, the fame extent will reach from 2000 to 5400 —— Seek 5400. in the Double Line of Numbers , and a- gainft it in the Broken Line , you fhall find 73,5 , for the number of men in Rank. —— Then for the num- ber of men in File ,

As 73,5 : is to 1 :: fo is 3000 to 41 *fere*.

Extend the Compaffes from 73,5 to 1 , the fame extent will reach from 3000 to 41 , and fo many men muft be in File —— But here the number of men are 3013 , which 13 over muft be fupplied , or elfe 28 men muft be taken off and difpo- fed of as Scouts, Centinels , or the like ; otherwife there muft be one File lefs.

Queft:

Quest. 6.

There are 8100 in a square Battail drawn up, and it is required to have 6 Ranks of Pikes to arme the same square Body round about ; how many Ranks must there be in the whole square Battail, and what number of Pikes and what of Musketeers?

THe Square Root of 8100 is 90, the number of men in Rank and File; now for that there must be 6 Ranks of Pikes about the Musketeers, there will be 12 Ranks less of them both in Front and Flank, than in the whole Body : wherefore subtract 12 from 90, there will remain 78, which number find in the Broken Line of Numbers, and right against it you shall find 6084, the number of Musketeers, and that taken from 8100, there remains 2061, for the number of Pikes.

SECT.

SECT. II.

Concerning the Quartering of Souldiers by the Lines.

Quest. 1.

If 1000 Souldiers may be lodged or quartered in a square of 300 foot of Ground, how many foot long must the side of a square be, that the Ground included may lodge 5000?

EXtend the Compasses from 1 to 300 (the side of the Square which will lodge 1000 Souldiers) the same extent will reach forward from 300 to 90000, then
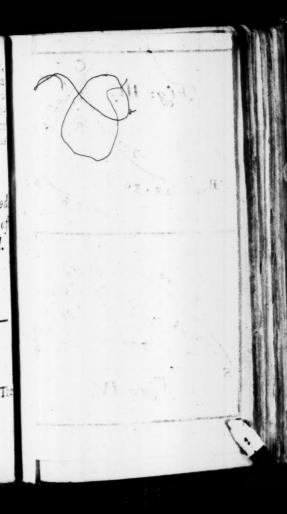

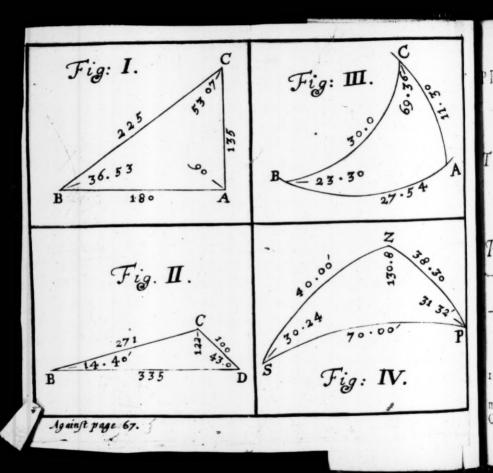

The Proportion will be

As 1000 : is to 5000 :: so is 90000 : to 450000.

Seek this number in the Double Line of Numbers, and against it in the

the Broken Line you shall find 671,
and so much must the side of a
Square be , that must lodge 500
Souldiers with the same conveni-
ence that 1000 Souldiers were
lodged in a Square whose side was
300 foot.

According to this Method
may all Questions of
this kind be resolved.

The USE of the
PROPORTIONAL
LINES
IN
TRIGONOMETRY:

OR,

The Mensuration of Triangles

BOTH

Plain and *Spherical*.

CHAP. V.

---

*Definitions and Theorems
Trigonometrical.*

1 A Triangle is a Figure consisting of three Sides and as
many Angles ; as is the Triangle
CAB, in *Fig.* I.   2. Any

2. Any two Sides of a Triangle are called the Sides of the Angle contained by them; as the Sides C B and A B, are the Sides containing the Angle C B A.

3. The meaſure of an Angle is the quantity of the Arch of a Circle, deſcribed upon the angular Point, and cutting both the Sides containing the Angle.

4. A Degree is the 360 part of any Circle. Therefore,

5. A Semicircle contains 180 degrees. And

6. A Quadrant (or right Angle) contains 90 degrees.

7. The Complement of an Angle leſs than 90 degrees, is ſo much as that Angle wanteth of 90 degrees.

8. The Complement of an Angle to a Semicircle, is ſo much as that Angle wanteth of 180 degrees.

9. An Angle is either Right, Acute, or Obtuſe.

10. A Right Angle is that whoſe meaſ-

measure is 90 degrees, or a Quadrant.

11. An Acute Angle is less than a right Angle, and always contains less than 90 degrees.

12. An Obtuse Angle is greater than a right Angle, and always contains more than 90 degrees.

13. A Triangle is either right-angled or oblique-angled.

14. A right-angled Triangle is such a Triangle as hath one right Angle. As the Triangle C A B, (*Fig. I.*) hath one right Angle, namely, that at **A**, which containeth just 90 degrees.

15. In every right-angled Triangle, that Side which subtendeth (or lieth opposite to) the right Angle is called the *Hypotenuse*; and of the other two Sides, the one is called the *Perpendicular*, and the other the *Base*, at pleasure: But most commonly the shorter side is called the *Perpendicular*, and the longer the *Base*.

Baſe.   Thus in the Triangle C B A,
B C is the Hypotenuſe, C A the Perpendicular,   and A B the Baſe.

16. In every right-angled Triangle, if you have one of the acute Angles given, the other is alſo given, it being the Complement thereof to 90 degr.   As in the Triangle C A B, if you have the Angle at C 53 degr. 7 min. given, you have alſo the Angle at B given, it being the Complement of that at C to 90 degr. wherefore take 53 degr. 7 min. from 90 degrees, and there will remain 36 degr. 53 min, which is the quantity of the Angle at B.

17. In all right-lined Triangles whatſoever (either right-angled or oblique-angled) the three Angles together are equal to two right Angles, or contain 180 degrees : Therefore if you have any two Angles of a Triangle given, you have alſo the third given, it being the Complement of the other two to 180 degrees.

rees : Thus, in the Triangle C D B, *Fig. II.* if there were given the Angle CDB, 43 deg. 20 min. and the Angle CBD 14 degrees 40 min. I fay, by confequence you have the third Angle DCB alfo given, it being the Complement of the other two to 180 degr. For the two given Angles BDC 43 degr. 20 min. and CBD 14 degr. 40 min. being added together, make 58 degr. which being taken from 180 degr. there will remain 122 deg. the quantity of the obtufe Angle DCB.

18. In all Triangles whatfoever, the Sides are in proportion one to the other as the Sines of the Angles oppofite to thofe Sides. So in the Triangle CDB, the Sine of the Angle at D, is in proportion to the Side CB, which is oppofite to it, as the Sine of the Angle at B, is to the Side CD, or the Angle at C, to the Side DB.

Thefe

being premised,
. . . . . . the Solution of *Plain*
Triangles both Right and Obliq.
angled.

I. *Of Right angled Plain Triangles.*

THE Triangle which I shall make
use of in the several Cases be-
longing to a *Right-angled Plain Tri-
angle,* shall be that *Fig. I.* noted with
C A B, In which

		parts
A B the Base,		180 .
C A the Perpendicular,	contain	135
C B the Hypotenuse,		225
And		deg.
A the Right Angle,		90 —
C the Angle at the Per.	contains	53 —
B the Angle at the Base,		36 —

CASE I.

*The Base B A 180, and the Perpen-
dicular C A 135, being given,
find the Angles B and C.*

Th

The Proportion is,

As the Logarithm of A B
  Is to the Logarithm of A C,
So is the Radius,
  To the Tangent of B.

Extend the Compasses from 180
the Base, to 135 the Perpendicular,
upon the Line of Numbers, the same
Extent will reach, the same way,
from the Radius (or Tangent of 45
deg.) to the Tangent of 36 deg.
52 min. the quantity of the Angle
at B.

CASE III.

The Hypotenuse C B 225, and the
Base A B 180, being given, to find
the Angles B and C.

The Proportion is,

As the Logarithme of C B,
  Is to the Radius;
                              So

So is the Logarith. of the Side AB
    To the Sine of C.

Extend the Compaffes from 215
the Hypotenufe, to the Radius (or
Sine of 90 degr.) the fame exten
will reach, the fame way, from 18
the Bafe, to 53 deg. 7 min. the qua
tity of the Angle at C.

           Or,

The diftance between 215 a
180, will reach from the Sine of 9
to the Sine of 53 degr. 7 min.
before.

CASE III.

The Bafe A B 180, the Angle C
    degr. 7 min. and the Angle B
    deg. 53 min. being given, to find
    Perpendicular C A.

The Proportion is;

As the Sine of the Angle at C,
    Is to the Logar. of AB,
    So is the Sine of the Angle B,
    To the Logar. of C A.

Or,

 As the Radius,

  Is to the Logar. of A B,

 So is the Tangent of B,

  To the Logar. of C A.

Extend the Compasses from the Sine of 53 deg. 7 min. the Angle at C, to 180 the Base, the same extent will reach from the Sine of 36 degr. 53 min. to 135 the Perpendicular C A.

Or,

Extend the Compasses from the Tangent of 45 deg. to 180 the Base, the same extent will reach, the same way, from the Tangent of 36 deg. 53 min. to 135 the Perpendicular, as before.

CASE IV.

The Hypotenuse C B 225, the Angle C 53 deg. 7 min. and the Angle at B 36 deg. 53 min. given, to find the Base B A, and the Perpendicular C A. E 2 The

The Proportion is,

As the Radius,
    Is to the Logar. of C B,
So is the Sine of C,
    To the Logar. of A B.
And the Sine of B,
    To the Logar. of C A.

Extend the Compasses from the
Sine of 90, to 225 the Hypotenuse
the same extent will reach from the
Sine of 53 deg. 7 min. the Angle
at C, to 180 the Base A B ——
And likewise, the same extent will
reach from the Sine of 36 deg.
53 min. to 135, the Perpendicu-
lar C A.

CASE V.

*The Hypotenuse C B 225, and the Base
A B 180, being given, to find the
Perpendicular C A.*

The Proportion is,

1. Operation.

As the Logar. of C B,
  Is to the Radius ;
So is the Logar. of A B,
  To the Sine of C.

2. Operation.

As the Radius,
  Is to the Logarithm of C B,
So is the Sine of B (the Comple-
    ment of C)
To the Logar. of C A.

Extend the Compasses from 225
the Hypotenuse, to the Sine of 90,
the same extent will reach from 180
the Base, to the Sine of 53 degr.
min. the Angle at C.

● Again,

Extend the Compasses from the
Sine of 90, to 225 the Hypotenuse,
the same extent will reach from the
Sine of 36 degrees 53 minutes, the

E 3   Angle

So is Tangent Z P 38 d. 30 m.
To Tangent P R 34 d. 6 m.

2. Operation.

As Co-ſine P R 55 d. 54 m.
Is to Co-ſine S R 54 d. 6 m.
So is Co-ſine Z P 51 d. 30 m.
To Co-ſine Z S 50 d.

I.

Extend the Compaſſes from the Sine of 90 deg. to the Co-ſine of P 58 deg. 28 min. the ſame extent will reach from the Tangent of Z P 38 deg. 30 min. to the Tangent of 34 deg. 6 min. for P R.

II.

Extend the Compaſſes from the Co-ſine of P R 55 deg. 54 min. to the Co-ſine of S R 54 deg. 6 min. the ſame extent will reach from the Co-ſine of Z P 51 deg. 30 min. to the Co-ſine of 50 deg. for Z S.

CASE

CASE V.

Two Sides Z P *and* S P, *with the Angle* P *contained between them, given, to find the Angle* S, *opposite to the Angle* P.

The Proportion is,
1. *Operation.*

As Radius 90 d.
  Is to Co-sine P 58 d. 28 m.
So is Tangent Z P 38 d. 30 m.
  To Tangent R P 34 d. 6 m.

2. *Operation.*

As Sine P R 34 d. 6 m.
  Is to Sine S R 35 d. 54 m.
So is Tangent P 31 d. 32 m.
  To Tangent S 30 d. 24 m.

I.

Extend the Compasses from Radius 90 deg. to the Co-sine of P 31 deg. 32 min. the same extent will reach from the Tangent of Z P 38 deg.

deg. 30 min. to the Tangent of 30 deg. 24 min. for the Angle at S.

II.

Extend the Compasses from the Sine of P R 34 d. 6 m. to the Sine of S R 35 d. 54 m. the same extent will reach from the Tangent P 31 deg. 32 m. to the Tangent of 30 deg. 24 m. for the Angle at S.

CASE VI.

Two Sides Z P *and* Z S, *with the Angle* P *opposite to* S Z, *given, to find the Angle* Z, *contained between the two given Sides.*

IN this Case the Base is alwayes the Side unknown.

The Proportion is,
1. *Operation.*

As Radius 90 d.
Is to Co-sine Z P 38 d. 30 m.

So

So is Tangent P 31 d. 32 m.
To Tangent R Z P 25 d. 38 m.

2. *Operation.*

As Tangent Z S 40 d.
Is to Tangent Z P 38 d. 30 m.
So is Co-sine R Z P 64 d. 22 m.
To Co-sine S Z R 58 d. 44 m.

I.

Extend the Compasses from Radius 90 deg. to the Co-sine of Z P 51 deg. 30 min. the same extent will reach from the Tangent of P 31 deg. 32 min. to the Tangent of 25 deg. 38 min. for the Angle R Z P.

II.

Extend the Compasses from the Tangent of Z S 40 deg. to the Tangent of Z P 38 deg. 30 min. the same extent will reach from the Co-sine of R Z P 64 deg. 22 min. to the Co-sine of 31 deg. 16 min.

CASE

CASE VII.

Two fides Z S and Z P, with the angle S oppofite to Z P given, to fint the fide S P adjacent to the given angle S.

The Proportion is,

1. *Operation.*

As Radius 90 d.
   Is to co-fine S 59 d. 36 m.
So is tangent Z S 40 d.
   To tangent S R 35 d. 54 m,

2. *Operation.*

As co-fine S Z 50 d.
   Is to co-fine Z P 51 d. 30 m.
So is co-fine S R 54 d. 6 m.
   To co-fine P R 55 d. 54 m.

I.

Extend the Compaffes from Radius 90 deg. to the co-fine of S 59 d. 36 m. the fame extent will reach from the tangent of Z S 40 deg. to the tangent of S R 35 deg. 54 min.

II.

Extend the Compasses from the co-sine of S Z 50 deg. to the cosine of Z P 51 deg. 30 min. the same extent will reach from the co-sine of S R 54 deg. 6 min. to the co-sine of P R 55 deg. 54 min.

CASE VIII.

Two angles S and Z , with the side S Z included between them given, to find the angle P opposite to the given side S Z.

IN this Case the Base may be either of the unknown sides.

The Proportion is,
1. *Operation.*

As Radius 90 d.
  Is to co-sine S Z 50 d.
So is tangent S 30 d. 24 m.
  To co-tangent R Z S.

2. *Operation.*

2. Operation.

As sine R Z S
  To sine R Z P;
So is co-sine S 59 d. 36 m.
  To co-sine P 58 d. 28 m.

I.

Extend the Compasses from Radius 90 deg. to the co-sine of S Z 50 deg. the same extent will reach from the tangent of S 30 degrees 24 minutes, to the co-tangent of R Z S.

II.

Extend the Compasses from the sine of R Z S to the sine of R Z P, the same extent will reach from the co-sine of S 59 degrees 36 minutes, to the co-sine of P 58 degrees 28 minutes.

CASE

CASE IX:

Two angles Z and P, with the side ZP between them, given, to find the side Z S opposite to the given angle at P.

IN this Case the Base is the side neither given nor sought as S P.

The Proportion is,
1 *Operation.*

As Radius 90 d.
  Is to co-sine Z P 51 d. 30 m.
So is tangent P 31 d. 32 m.
  To co-tangent R Z P.

2. *Operation.*

As co-sine R Z S
  Is to co-sine R Z P,
So is tangent Z P
  To tangent Z S

I.
Extend the Compasses from Radius 90 degr. to the co-sine of Z P
               51 degr.

51 degr. 30 min. the same extent
will reach from the tangent of P
31 degr. 32 min. to the co-tangent
of R Z P.

II.

Extend the Compasses from the
co-sine of R Z S, to the co-sine of
R Z P, the same extent will reach
from the tangent of Z P 38 deg. 30
min. to the tangent of Z S 40 de-
grees.

CASE X.

*Two angles S and P, with a side oppo-
site to one of them S Z, given, to
find the other angle Z.*

IN this Case the Base is the side op-
posite to the angle sought.

The Proportion is,
1. *Operation.*

As Radius 90 d.
  Is to co-sine Z S 50 d.

So is tangent S 30 d. 24 m.
    To co-tangent S Z R.

2. *Operation.*

As co-fine S 59 d. 36 m.
    Is to co-fine P 58 d. 28 m.
So is fine S Z R ,
    To fine R Z P.

I.

Extend the Compaſſes from Radius 90 degr. to the co-fine of Z S 30 degr. the ſame extent will reach from the tangent of S 30 degr. 24 min. to the co-tangent of S Z R.

II.

Extend the Compaſſes from the co-fine of S 59 degr. 36 min. to the co-fine of P 58 d. 28 m. the ſame extent will reach from the fine of S Z R to the fine of R Z P.

CASE

CASE XI.

*The three fides S Z, P Z, and S P, given,
to find an angle, viz. the angle at Z.*

IN this Cafe the fide oppofite to
the inquired angle is the Bafe.

Before the Triangle can be refol-
ved, you muft

First, Adde the three fides toge-
ther, and note the fum of them.

Secondly, Take the half there-
of, which call the half fum.

Thirdly, From the half fum, fub-
ftract the Bafe, and note the diffe-
rence, as you fee here done.

The Side	S Z	40 00
	Z P	38 30
	S P	70 00
The Sum		148 30
The half Sum		74 15

From which fubftract the
Bafe 70 deg there remains } 4 15
the difference ———

This

This preparation being made,
   the proportion will be,

1 *Operation.*

As Radius 90 d.
   Is to fine Z S 40 d.
So is the fine of Z P 38 d. 30 m.
   To a fourth fine, *viz.* 23 d. 35 m.

2 *Operation.*

As the fine of 23 d. 35 m.
   Is to the fine of the half fum
   74 d. 15 m.
So is the fine of the difference
   4 d. 15 m.
   To a seventh fine, *viz.* 10 d. 17 m.

I.

Extend the Compasses from Radius 90 deg. to the fine of Z S 40 deg. the fame extent will reach from the fine of Z P 38 deg. 30 min. to a fourth fine, *viz.* 23 deg. 35 min.

II.

Extend the Compasses from the fine of 23 deg. 35 min. to the fine of
                                    the

the half sum 74 degr. 15 min. the
same extent will reach from the sine
of the difference 4 deg. 15 min. to the
seventh sine, viz. 10 deg. 17 min.

Divide the space upon the Line of
Sines betwen 10 deg. 17 min. and
90 degr. into two equal parts, and
the Compass point shall rest upon
24 deg. 56 min. whose Complement
is 65 deg. 4 min. and that doubled
makes 130 deg. 8 min. for the an-
gle at Z.

CHAP. XII.

*The three angles Z, S, and P, given, to
find a side.*

THis is but the converse of the
former Case, and may be resol-
ved in the same manner, if for ei-
ther of the angles next to the side re-
quired, you take its complement to
180 degr. those angles will be turned
into sides, and the sides into angles,
and then may the triangle be resolved
as in the preceding Case.

ASTRONOMY.

CHAP. V.

Argument.

I Shall not in this place go about to give you any Description of the Circles of the Sphere or Globe, suppofing my Reader to be acquainted with them already; and in refpect I have fufficiently treated of them elfewhere, as in my *Ufes of the Globes*, and also in my *Geometrical Exercifes*; which Book will explain and make eafie

G   some

some things which in this Tractate
may be omitted, or at least, for bre-
vity, lightly passed over.

Probl. I.

The distance of the Sun *from the near-*
est Æquinoctial Point (*either* Ari-
es *or* Libra) 59 *deg. given, to find*
his Declination.

The Proportion is,

As the Radius 90 deg.
 Is to the Sine of the Sun's greatest
  Declination 23 deg. 30 m.
So is the Sine of the Sun's distance
 from the next Æquinoctial Point
 Libra 59 degr.
 To the sine of the Sun's present
  Declination 20 degr.

 Extend the Compasses from the
sine of 90, to the sine of 23 deg.
min. (the Suns greatest Declinati-
on) the same extent will reach from
59 deg. (the Suns distance from

Libra, to the sine of 20 deg. the Suns present Declination.

The *like* Declination *the* Sun *hath when he is in* 29 *degr.* of TAURUS, *in* 1 *degr.* of LEO, *or* 29 *degr.* of Scorpio, *every of which Points are distant from one of the* Æquinoctial Points Aries *or* Libra 59 *deg.*

Probl. II.

The Latitude *of the Place*, 51 *deg.* 30 *min. and the* Declination *of the* Sun 20 *deg. being given, to find the* Ascensional Difference.

The Proportion is,

As the co-tangent of the Latitude 38 deg. 30 min.

Is to the tangent of the Suns Declination 20 degr.

So is the Radius 90 deg.

To the sine of the Ascensional Difference 27 deg. 14 min.

G 2   Extend

Extend the Compasses from the tangent of 38 deg. 30 min. the complement of the Latitude, to 20 deg. (the Suns Declination) the same extent will reach, the same way, from the sine of 90 deg. to the sine of 27 deg. 14 min. the Ascensional difference; which is the quantity of time that the Sun rises or sets before or after Six of the Clock.

So these 27 degr. 14 min. being turned into Time (by allowing 15 deg. for one hour, and one degree for 4 minutes of Time) is 1 hour and 49 min. and so much doth the Sun rise or set before or after the hour of Six, according to the time or season of the year; for if the Sun hath *North Declination*, then he *riseth before six* and *sets after*: but if the Sun have *South Declination*, then doth he *rise after*, and *sets before Six*.

This Ascensional Difference being added to Six hours, will give you the

Semidiurnal Arch or *Half-length* of *the Day* ; *and being taken from Six hours* , *will leave the Seminocturnal* Arch, or *Half-length of the Night*.

Probl. III.

The Latitude *of the Place* 51 *deg.* 30 *min. and the* Declination *of the* Sun, 20 *deg. being given, to find his* Amplitude.

The Proportion is,

As the co-sine of the Latitude 38 deg. 30 min.

Is to the Radius 90 deg.

So is the sine of the Sun's Declination 20 degr.

To the sine of the Amplitude from the East or West points of the Horizon 33 degr. 20 min.

Extend the Compasses from the sine of 38 deg. 30 min (the Complement of the Latitude) to the sine of 90 deg. the same extent will reach

G 3   from

from the fine of 20 deg. (the Suns
Declination) to 33 deg. 20 min.
(the Amplitude, or) the diftance
that the Sun rifes or fets from the
true Eaft or Weft Points, towards ei-
ther the North or South.

Probl. IV.

The Latitude *of the Place ,* 51 deg,
30 min. *and the* Declination *of the*
Sun 20 deg. *being given, to find the*
Angle of the Sun's Pofition *at the*
time of his rifing.

The Proportion is,

As the co-fine of the Declinati-
on 70 degr.

Is to the Radius 90 degr.

So is the fine of the latitude 51
degr. 30 min.

To the fine of the Angle of the
Suns Pofition at the time of his rifing.

Exrend the Compaffes from the
fine of 70 deg. (the complement of
the

the Suns Declination) to the fine of
90 ; the fame extent will reach from
the fine of 51 deg. 30 min. the lati-
tude) to the fine of 56 deg. 29 min.
(the angle of the Sun's pofition at
the time of his rifing.)

Probl. V.

*The Sun's Declination 20 deg. and
his Amplitude 33 deg. 20 min. from
the Eaft or Weft part of the Hori-
zon, being given, to find the Lati-
tude.*

The Proportion is,

As the fine of the Amplitude from
the Eaft or Weft 33 deg. 20 min.

Is to the Radius 90 deg.

So is the fine of the Declination
20 deg.

To the co-fine of the Latitude 38
degr. 30 min.

Extend the Compaffes from the
fine of 33 deg. 20 min (the Sun's
Amplitude from the Eaft or Weft)

to

to the fine of 90 deg. the fame extent will reach from the fine of 20 deg. (the Sun's Declination) to the fine of 38 deg. 30 min. (the complement of the Latitude, 51 deg. 30 min.)

Probl. VI.

The Sun's *greateft Declination 23 deg. 30 min. with his Diftance from the next Æquinoctial Point (Aries or Libra, 59 deg.) being given, to find his Right Afcenfion.*

The Proportion is,

As the Radius 90 deg.

Is to the co-fine of the greateft Declination 66 deg. 30 min.

So is the tangent of the Sun's diftance from the next Æquinoctial point *Libra* 59 deg.

To the tangent of the Right Afcenfion 56 deg. 50 min.

Extend the Compaffes from the fine

fine of 90 deg. to the fine of 66 deg. 30 min. (the complement of the Sun's greateſt Declination ;) the ſame extent will reach from the tangent of 59 deg. (the Suns diſtance from the next Æquinoctial Point) to the tangent of 56 deg. 50 min. (the Suns Right Aſcenſion.)

Probl. VII.

The Latitude *of the* Place 51 deg. 30 min. *and the* Suns *Declination* 20 deg. *being given , to find at what hour the Sun will be upon the true* Eaſt *or* Weſt *Points.*

The Proportion is ,

As the tangent of the Latitude 51 deg. 30 min.

Is to the tangent of the Suns Declination 20 degr.

So is the Radius 90 degr.

To the co-fine of the Hour from Noon,

G 5   Extend

Extend the Compaſſes from the tangent of 51 deg. 30 min (the Latitude) to the tangent of 20 deg. (the Suns Declination) the ſame extent will reach from the ſine of 90 deg. to the ſine of 16 deg. 50 min. the complement of the time from Noon, that the Sun will be due Eaſt or Weſt.

Which converted into hours and minutes, will be 4 hours and about 53 min. So that the Sun, when he hath 20 degr. of Declination, will come to the Eaſt Point at 7 min. paſt 7 in the Morning, and will be due Weſt 53 min. after 4 in the Afternoon.

Probl. VIII.

Having the Latitude of the Place 51 *deg.* 30 *min. and the Suns* Declination 20 *deg. given, to find what Altitude the Sun ſhall have when he is upon the true Eaſt or Weſt Points.*

The

The Proportion is,

As the sine of the Latitude 51 deg. 30 min.

Is to the Sine of the Declination 20 degr.

So is the Radius 90 degr.

To the Sine of the Suns Altitude being due East or West 25 degr. 55 min.

Extend the Compasses from the sine of 51 deg. 30 min. (the Latitude) to the sine of 20 deg. (the Declination) the same extent will reach from the sine of 90 deg. to the sine 25 deg. 55 min. the Altitude that the Sun shall have when he is upon the East or West Points.

Probl. IX.

The Latitude *of the Place* 51 *deg.* 30 *min. and the Suns* Declination 20 *deg. being given, to find what Altitude the Sun shall have at Six of the* Clock.   The

The Proportion is,

As the Radius 90 degr.

Is to the ſine of the Suns Decli-
nation 20 degr.

So is the ſine of the Latitude 51
deg. 30 min.

To the ſine of the Suns Altitude
at Six, 15 deg. 30 min.

Extend the Compaſſes from the
ſine of 90 deg. to the ſine of 20 deg.
(the Suns Declination) the ſame ex-
tent will reach from the ſine of 51
deg. 30 min. (the Latitude) to the
ſine of 15 deg. 30 min. (the Alti-
tude that the Sun ſhall have at Six of
the Clock.)

Probl. X.

The Latitude *of the Place* 51 *deg.* 30
min. and the Declination *of the*
Sun 20 *deg. being given, to find
what* Azimuth *the Sun ſhall have at
Six a Clock.*

                              Tho

The Proportion is,

As the co-sine of the Latitude 38 degr. 30 min.

Is to the Radius 90 deg.

So is the co-tangent of the Suns Declination 70 degr.

To the tangent of the Suns Azimuth counted from the North part of the Meridian 77 deg. 14 min.

Extend the Compasses from the sine of 38 deg. 30 min (the complement of the Latitude) to the sine of 90 deg. the same extent will reach from the tangent of 70 deg. (the complement of the Suns Declination) to the tangent of 77 deg. 14 min.) the Suns Azimuth counted from the North part of the Meridian) or 12 degr. 46 min. the Azimuth from the East or West, or 102 deg. 46 min. from the South.

Probl.

Probl. XI.

The Latitude of the Place 51 deg. 30
min. the Declination of the Sun,
20 deg. South, and the Suns Alti-
tude 12 deg. given, to find the Suns
Azimuth either from the East,
North, or South Points of the Ho-
rizon.

TO reſolve this Problem , you
muſt find the Complement of
the Latitude , the Complement of
the Altitude, and the Complement
of the Declination , and add all
three of them into one Snm, and take
the half thereof ; from which half
ſum ſubſtract the Complement of
the Suns Declination , and note
the difference ; as you ſee here
done.

Com-

Complement of the	{	Latitude	38	30
	{	Altitude	78	00
	{	Declinat.	110	00

	Their Sum	226	30
	Half Sum	113	15
Comp. Declinat. ſub.		110	00
	The Difference	3	15

Having found the Sum , the half Sum, and the Difference, you may work by the following

Proportion ,

1. As the Radius 90 degr.

Is to the co-ſine of the Latitude, 38 deg. 30 min.

So is the co-ſine of the Altitude 78 degr.

To the ſine of a fourth number, which is 37 deg. 30 min.

2. As

Take this fourth Term 16 deg. 1 min. from 57 deg. 35 min. the complement of the lesser Latitude, and the remainer will be 41 deg. 34 min.

And fay again,

(2.) As the fine of 73 deg. 59 min. (the complement of the fourth Term before found)

To 48 deg. 26 min. (the complement of the Remainer,)

So is the fine of 50 deg. (the greater Latitude,)

To the fine of 36 deg. 36 min. (whose complement 53 deg. 24 min.) is the diftance, which in miles is 3205.

The

The USE of the
PROPORTIONAL
LINES
IN
NAVIGATION.

CHAP. VIII.

THE principal Problems in use
with Mariners in their Navigations (besides those of Astronomy and Geography in the foregoing Chapters) are such as concern
Longitude, *Latitude*, *Rumb*, and
Distance, a few of which I shall shew
how to perform by the *Proportional
Lines.*

Example

Examples in Figure I.

In which Figure,

C A reprefent the Meridian, *C* North and *A* South.

B A, A Parallel of Latitude, *B* Weſt and *A* Eaſt.

C B, A Rumb 53 deg. 7 min. diſtant from the Meridian Weſtward, which Rumb is N. W. 8 deg. 7 min. Weſterly from *C*. and N. E. by N. 19 min. Eaſterly.

And ſo

C B Is the Courſe or Rumb.

C A The difference of Latitude, and

E A The departure from your firſt Meridian.

<div align="right">Probl. 1.</div>

Probl. 1.

*The course and distance given, to find
the difference of Latitude and de-
parture from your first Meridian.*

SAiling from C 225 min the Course
or Rumb is N W 8 deg. 7 min.
Westerly (that is 53 deg. 7 min.
from the Meridian) I demand how
much I have altered my Latitude,
and how far I have departed from
my first Meridian.

The Proportion is,

As Radius 90 deg.

Is to the distance sailed 225
min.

So is the sine of the Rumb 53 deg.
7 min.

To 180 the departure from
your first Meridian.

And

And

So is the complement of the Rumb 36 deg. 53 min.

To 135 min. the difference of Latitude 1.

Extend the Compasses from the sine of 90 deg. to 225, the same extent will reach from 53 deg. 7 min. the Rumb, to 180 min. for your departure: —— And also the same extent will reach from 36 deg. 53 min. the complement of the Rumb, to 135 min. for the difference of Latitude.

Probl. 2.

The course and difference of Latitude given, to find the distance sailed, and the departure from your first Meridian.

Let the Course be N.W. 8 deg. 7 min. Westerly (or 53 deg. 7 min. from the Meridian) as before; the
diffe-

difference of Latitude **135** min. and let the distance sailed **C B** , and the departure **B A** be required.

The Proportion is,

As the Co-sine of the Course 36 deg. 53 min.

Is to **135** min. the difference of Latitude ;

So is Radius 90 deg.

To **225** min. the distance sailed.

And

So is the sine of the Rumb 53 deg. 7 min.

To 180 min. the departure.

Extend the Compasses from 36 deg. 53 min. to **135** , the same extent will reach from 90 deg. to 225 for the distance sailed : —— And from 53 deg. 7 min. to 180 min. the departure from your Meridian.

Probl. 3.

Probl. 3.

The course and departure being given, to find the distance sailed and the difference of Latitude.

LEt the course be N. W. 8 deg. 7 min. Westerly (or 53 deg. 7 min. from the Meridian) and the departure from the Meridian 180 min. and let the distance sailed and the difference of Latitude be required.

The proportion is,

As the sine of the course 53 deg. 7 min.
Is to the departure 180 min.
So is Radius 90 degr.
To 225 the distance sailed.

And

So is the complement of the course 36 deg. 53 min.
To 135 min. the difference of Latitude.

Extend

Extend the Compasses from the
sine of 53 deg. 7 min. to 180 min.
the same extent will reach from the
sine of 90 deg. to 225 min. the di-
stance sailed ; and the same extent
also will reach from 36 deg. 53 min.
the complement of the course, to 135
min. the difference of Latitude.

Probl. 4.

The difference of Latitude and distance
sailed, given, to find the course and
departure from the Meridian.

A Ship sails between the North
and the West 225 min. so long
till she hath altered her Latitude
135 min. I demand what course the
Ship hath made, and also how far
she hath departed from her first Me-
ridian.

The Proportion is,

As the sine of 90 degr.
Is to 225 m. the distance sailed,
So

So is 135 min. the difference of Latitude,

To 36 deg. 53 min. the complement of the course that the Ship failed.

And

So is the fine of 53 deg. 7 min.
To 180 min. the departure.

Extend the Compasses from 225 min. to the fine of 90 deg. the same extent will reach from 135 min. to 36 deg. 53 min. whose complement 53 deg. 7 min. is the course. —— And the same extent also will reach from 53 deg. 7 min. to 180 min. the Ships departure from the first Meridian.

Probl. 4.

Probl. 4.

The distance and departure given, to find the course and difference of Latitude.

THe distance sailed is 225 min. and the departure is 180 min. I demand the course and difference of the Latitude : For which

The proportion is,

As 225 the distance sailed,
  Is to the sine of 90 deg.
So is 180 the departure,
  To the sine of 53 deg. 7 min. the course.

And

So is the sine of 36 deg. 53 min. the Complement of the Course,
  To 135 min. the difference of Latitude.

Extend the Compasses from 225 min. the distance, to 90 deg. the same

same extent will reach from 180
min. the difference, to 53 deg. 7
min. the course, which is N. W. 8
deg. 7 min. Westerly —— And the
same extent will reach from 36 deg.
53 min. the complement of the
course, to 135 min. the difference
of Latitude.

Probl. 5.

The diffeeence of Latitude and depar-
    ture given, to find the course and
    distance.

THE difference of Latitude is 135
    min. and the departure is 180
min. the Rumb and Distance is re-
quired:

The Proportion is,

As 135 min. the difference of La-
titude,

Is to Radius (or Tangent of 45
degr.)

So is 180 min. the distance,

     To the tangent of 53 deg. 7 min. the course.

And

So is the tangent of 45 deg.

     To 225 min. the distance sailed.

Extend the Compasses from 135 min. the difference of Latitude, to the tangent of 45 deg. the same extent will reach from 180 min. the distance, to the tangent of 53 deg. 7 min. or N. W. 8 deg. 7 min. Westerly for the course. —— And the same extent also will reach from the tangent of 45 deg. to 225 min. distance sailed.

SUPPLEMENT
TO THE
LINE of PROPORTION,
OR,
NUMBERS.

Containing

The Description, and some Uses of
a convenient Two-Foot

JOYNT-RULE:

Upon which is inscribed divers LINES
and SCALES for several Uses sutable to all sorts of Artificers, or Workmens occasions.

And also by the same RULE to take the
Heights and Distances, and to make
the most usual sorts of SUN-DIALS.

By *JOHN BROWN.*

AN

INTRODUCTION.

Having formerly endeavoured, to promote the use of so excellent a Line, as that of the Line of Numbers, and finding by a series of experience of my self and others, that the greatest difficulty lies in Reading thereof, and in the discovery of the right Number of Places, in Multiplication or Division.

Therefore to make this difficulty easie and familiar, and certain for young beginners, or better proficients coming suddenly to the use thereof I have drawn this Line to 8 Radiusses, or 8 Revolutions of one Line of Numbers and added thereunto a Line of Time and Money, (and

after

after the same manner may any other par
ticular thing be added, according to an
mans occasion) endeavouring thereb
as much as may be , to make the Lin
speak, as it were : Whose Application
short is thus.

The first 1 at the beginning represe
the Ten Thousandth part of an Inte
ger or 1 ; the second 1 is the Thousand
part of any thing ; the third 1 is th
Hundredth part of an Integer ; the fourt
1 is the Tenth part of any thing ; an
the fifth 1 at the end of the print is
Integer or 1 of any thing ; and next t
this, above this Line of Numbers , is
Line of Time, fitted for Questions of I
terest at 6 per Cent. per Annum.

And next to it , Under it is a Line fo
Money, 1 Pound or 20 s. being Inte
ger , giving the interest of a 100
for any time by Inspection , and of an
other Sum by one operation for any tim
whatsoever.

In the middle of the Whit B anck be
low this Line of Pence, is this print t

be cut, and 1 at the end of the first Lines, to be pasted exactly on 1 on the beginning of the other Lines; then the first 1 here, represents 1 of any thing, as 1 Foot, 1 Inch, 1 Pound, &c. the second 1 represents 10 Integers, the third 100 Integers, the fourth 1000 Integers, the fifth 10000 Integers, &c. And the Figures and Cuts between every Radius or 1 expressed as much as may be, and being so Cut and pasted together, you may read any Number from the 1000 part of an Integer, to 10000 Integers, and 1 being in the middle, is convenient to extend to any Numbers under or over 1; and thereby fractions in Money or Time are wrought as soon as whole Numbers, and as easily, as by a little practice you shall find; and if any difficulty as to method of computation, arise by the other Lines; of 1 or 2 Radiusses, by this of 8 you may be presently resolved.

Though I must needs grant, that the single Line works the Question more exactly,

ctly , becaufe done to 8 times a greater
Radius ; yet know that on a Circle of a
Foot Diameter , this may be as well done
to 8 or 10 Radiuffes, as to 1 Radius on
a 3 foot Rule , which will alwayes ap-
proach to 4 Figures if truely made , and
fu h prints you may have ready pafted
on a Board at the fign of the *fphear* and
Dial in the *Great Minories London.*

A fhort Touch of the ufes of thofe Lines, and
a little Direction for thofe that are not
acquainted with them.

First for Multiplication.

THe 4 upper Radiuffes being un-
der or lefs then 1 , being cut
from the 4 lower Radiuffes
more then 1 , and the ftroke
of 1 at the end of the Radiuffes under
1 being pafted exactly on the 1 , at the
beginning end of the 4 Radiuffes , a-
bove or more then 1 ; (or if thefe Prints
are too fmall , you may have them made
of any length) then in Multiplication ,
alwayes the Rule is thus ,   The

The extent from 1 in the middle, so any number over or under 1 being the Multiplier; the same extent shall reach from the Multiplicand, being laid the same way to the Product.

Example, Let ,005 be multiplied by 5, the extent from 1 to 5 shall reach, from ,005 to ,025, the Product being but a quarter and less then 1.

Again, To multiply 1,79 by 206,50 the extent from 1 to 1,79 being laid the same way from 206,50 gives 369,6350, the Rule sheweth you certainly that 370 is the greatest Integer though you cannot see all the other Fractions, yet this insures you of the Numbers of places of Integers, and the multiplier and multiplicand by inspection the right number of Figures, as afterwards in using the double lines, in the same manner for any other Multiplication whatsoever.

Division, the Rule is alwayes thus,

THE extent from the Divisor to 1 reaches the same way from the Di-

vidend

vider to the Quotient ; Example, In a
Decimal whole Number and Fraction. In
123 *l.* 500 parts, how many Stone 14 *l.*
to the Stone ? The extent from 14 to
being laid the same way, from 123
gives 8 stone and 082 parts, then the same
extent laid the contrary way from 082
gives 11 *l.* and the remainder in pounds
weight under 14 *l.* 1 stone.

In the Rule of Three the Method always is

THe extent from the First to the Se-
cond , reaches the same way from
the Third to the Fourth.

Example , If 3 Ounces and of Silk
cost 3 *s.* 4 *d.* what cost 17 Ounces ; the
extent from 3 to 3 *s.* 4 *d.* in the Mo-
ney Line, shall reach the same way from
17 3 fourths, to 16 *s.* and 1 *d.* 3 *f.* on
the Money Line. Again,

If the Interest of 100 *l.* be 6 *l.* in 365
dayes, what shall the Interest of 20 *l.* be
in 40 dayes ? The extent from 100 to

40 dayes on the line of time , reaches from 20 *l.* to 2 *s.* 7 *d.* 2 *f.* on the money line : Or you might have counted thus, Just against 40 dayes on the line of time, on the money line , is 13 *s.* 2 *d.* the Interest of 100 *l.* in 40 dayes, then as 100 *l.* to 13 *s.* 2 *d.* so is 20 *l.* to 2 *s.* 7 *d.* 2 *f.* as before.

The Back Rule of Three may alwayes be resolved by the Direct Rule, by a due understanding and right stating the Question, also the Double and Compound Rule at two operations , or by preparing the Numbers , which is onely the Direct Rule twice or thrice repeated, according to the nature of the Question , which cannot be expressed now but by many words , too long for this place ; therefore for this matter , I refer you to Page 133 of the Triangular Quadrant, or to Mr. *Kerseys* Arithmetick Page 77.

For

For the extracting of the Square and Cube-roots, the Rule is alwayes thus by the Line of 8 Radiusses,

THe First, Of one or two mean proportions, (Geometrical) between 1 and the number given is alwayes the Square or Cube-root.

Example 1, For the Square-root in two examples,

1. What is the Square-root of 126, 5625 a whole Number and a Fraction? The exact middle between 1 and 126, 5625 will be at 11,25 the Square-root required.

2. What is the Square-root of ,00527 a Fraction? The exact middle between 1 and ,00525 a number lesser than 1, is ,023 the Square root required.

Secondly, *For the Cubick root alwayes thus*,

Example 1. What is the Cubick root of 1275,63 the first of two Geometrical mean proportions between 1 and 1275,63 is at 10,080, the Cubick root being found by dividing the space on the Line of Numbers (in 8 Radiusses) between 1 and 1275,63 into three equal parts exactly, and the first beyond 1 is 10,848 the Cube-root required.

2. Again, The Cube-root of ,00053 a number lesser then 1, is ,0175, for the first of two mean proportionals between 1 and ,00053 is at ,0175, found by dividing the distance between 1 and ,00053 into three equal parts, counting and using the first proportional from 1 toward the number propounded.

The Use and Application of the Square and Cube-root, is to work proportions in Superficies or Solids, as in pages 107, 108, 109,

109,110 , and in page 116, 117, 118, 119 120, 122; and 335,236, 337 of the Triangular Quadrant, in brief as a taste thus,

> If a fathom of Rope of 6 inches compass
> weigh 6 pound one eighth , what shall
> a fathom of Rope of 12 inches compass
> weigh?

The extent from 6 to 12 being twice repeated from 6,125 shall reach to 24,50 the weight of a fathom of Rope of 12 inches about.

On the contrary, The Areas or Square given to find the sides,

Example is , If the content of a quarry of 10 s. be 0,1, and the content of a quarry of 12 s. 00,833 , divide the space between 0,1 and 00,833 into two equal parts, then that extent laid the same way from 6 the length of square 10 s. shall reach to 5,47 the length of square 12 s. and from 4 the breadth of squares 10 s. to 4,38 the breadth of square 12 s.

Ex-

Example again for Solids , If an Iron Bullet 6 Inches Diameter weigh 30 pound what shall a Bullet of 8 Inches Diameter weigh? The extent from 6 to 8 shall reach at three repeatings from 30 to 71 one third , on the contrary one third part of the extent on the numbers from 71 one third to 30, shall reach from 8 to 6 the Diameters of the Shot ; and so for any other the like.

But note , That the trebble and single Line is quicker and easier, and saves the trouble of dividing into two or three parts ; for the extent from 6 to 8 on the single Line , reaches from 30 to 71 one third on the trebble line , and the contrary.

Lastly, For simple Interest, by the line of Time and Money.

Count the Time on the line of Time , from a day to 100 year , and just against on the Money line, is the Interest of 100 *l.* for that time, and for any other Sum thus ,

The

The extent from 100 on the Numbers to the time counted on the line of time, shall reach the same way from the sum of money propounded to the interest thereof in time.

Example, The extent from 100 counted on the Numbers to 6 _l._ count d on the money line, shall reach the same way from 30 _l._ counted on the Numbers to 1 _l._ 16 _s._ the interest due for 30 _l._ in 12 months time:

But for this matter there is enough in the following discourse and the work is best done by the larger lines; but to see the true Number of Places, and see the increase, and the decrease of Geometrical porportion, the line of 8 or more Radiusses will prove an excellent help to Learners, for whose sake it is here inserted.

THE

THE
DESCRIPTION.
OF THE
Joynt Rule.

*The lines on this Rule, or the lines made
in part or in the whole may be varied ac-
cording to any man's particular use or
inclination in some part thereof: yet a
description must be of some thing, that
which my present thoughts calls most
convenient is as followeth.*

1. First, next to *inches* in 8 parts for
one foot is annexed the *foot mea-
sure,* for ready *Reduction* and al-
so for *Mensuration.*

2. Next the other part is set the *price
of one foot* of *Brick-work* at any value per
rod in the nature of a Scale.

3 Then

3. Then on the same flat-side, as lines on a *Sector* drawn from a *center*, is a scale 10 30, and every integer parted into parts to represent *inches*, or every 5th minute, every integer being a *model*.

4. Next to this is another scale of the same length divided into 40 integers or feet.

5. Next to, or as neer as may be to the 30 scales on the head leg, is added a line of *Natural Sines*, but Figured as the line of *Chords* to 180 degrees, to measure any Angle readily; to which is added a line of *Tangents* in pricks to 63,30, for several uses.

6. On the inner line of the 30 scales are set points to divide a Circle into 20 or more or any number of parts.

7. On the edge of the Rule is set the line of *Numbers*, to which is added the decimal Fractions of a pound *sterling*, the inches in a foot to 12 foot, and several points for several uses more than formerly have been thought on.

8. On the inside is set the ordinary lines

lines of *Timber* and *Board* measure.

9. On the other flat side is set the lines proper to a <u>Quadrant</u>,

As the degrees, the line of *shadows*, the months and dayes of the year, the *Suns declination, rising,* and *setting;* his *hour,* and *Azimuth, Amplitude ectiue* and *occasiue:*

And a perpetual *Almanack:* All these on one leg as by their names appear.

10. On the other is set a *line of lines,* or *equal parts;* a line of *Natural sines* to find the *hour* and *Azimuth* generally, and a line of *sines* for a perpetual *Latitude,* as the several names manifest.

11. On the spare place is set the scales for *Diameter, Circumference* and *Square equal* and *inscribed;* or a *Tide-table* of 24 hours, and the *Moons* age, or any thing else thought convenient, the uses of all which are here briefly and plainly delivered.

Use

Use I.

Of Inches and Foot measure.

The use of Inches, and Foot measure as to taking of Dimensions, is here needless: Reduction by those Lines from 10 to 12 and the contrary, is obvious to every considerate observer.

FOR as 6 is half 12, so 50 is half 100, and consequently 3 foot 7 inches and 7 eights to be reduced to decimals, it will be, 3, 656: for just against 7 inches and 7 is on the Line of Foot measure 656, the 65 is expressed and the last 6 estimated.

And on the contrary, if 3 foot and 46 parts were to be reduced to inches and eight parts, look for 46 on the line of foot measure, and just against it on the Inches, is 5 inches and ½ the answer.

The same holds in money or any thing, where the integer is parted into 12 parts,

is 12 pence in a shilling, or 12 dozen in
a groce, or the like.

Use II.

*The price of 1 of any Commodity given,
to find the price of 100.*

First, for any rate under 100 shillings
or 5 *l.* per 100, count thus,

Count the shillings per 100 on foot
measure, and right against it on the in-
ches is the price of one in pence and
farthings

Example, *At 48 shillings per 100 what*
cost 1 ?

Seek for 48 shillings on foot measure
and right against it on inches is 5 *d.* 3
farthings, the Answer required.

On the contrary at 7 *d.* for one coun-
ted at 7 inches on foot measure is 58 *s.*
3 *d.* the price of 100.

In this counting every inch is 1 penny,
but if the sum be between 5 *l.* and 10 *l.*

per

per 100, then call 10 on the foot measure 1 *l.* and every half inch 1 penny.

Example, At 7 *l.* 8 *s.* per 100 counted at 74 on Foot measure, on the inches is 17 *d.* 3 farthings by doubling the inches or counting every half inch for a penny.

Again, on the contrary, at 18 *d.* for 1 being counted at 9 inches, right against it on foot measure, is 7 *l.* 10 *s.* per 100.

But if the sum be above 10 *l.* per 100 or square, then this is the best way, Double the 10 *s.* of pounds, and the sum call shillings double also the units of pounds, and if the sum be above 10, add 1 *s.* more, and the remainder call 10 *s.* of shillings, to which add the remaining shillings and pence if any be, and seek it on the line of foot measure, and just against it on the inches is the remaining pence, and 8 parts of a penny required : Example, At 72 *l.* 15 *s.* 10 *d.* per square or 100, what comes 1 foot (or one) to in money ?

First double 7 the tens of pounds and it is 14 *s.* then the two pounds counted

as

10 s. of shillings is 40 s. and the 15 s.
over makes 55 s. and 10 d. which 55 s.
and 10 d sought on foot measure on the
inches is 6 d. 2 farthings, and 3 quarters
of a farthing, in all 14 s. 6 d. 2 f. ¾ the
exact price of 1 foot (or 1) at 72 l. 15 s.
10 d. per square or 100.

Again On the contrary, the price of
1, or 1 foot being given, to find the price
of 100 or a square.

Halve the shillings, and reduce the pence
and farthings to decimals by the foot
measure, and then halve that also, and the
sum is the answer.

Example, at 9 s. 9 d. 2 f. ½ per foot what
comes a square to.

The half of 9 is 4 for 40 l. and car-
ry 1. Then 9 d. 2 f. ½ farthing reduced
by foot measure is neer 80 to which ad-
ding 100 for the 1 carryed, makes 180,
whole half is 90, for 9 l. in all 49 l. per
square, the exact Answer required.

Or count thus, For every shilling per
foot count so many hundreds, then the
pence and farthings being reduced to de-
cimals,

'cimals by foot measure, add to the hundreds,
dreds, and the half of that sum is the
price of 1 square; or 100 being
halved after the way of bringing of shil-
lings to pounds in this manner,

Example, at 15 s. 6 d. 2 f per foot
what comes 100 to?

First, for 15 s. set down —— 15s.

Then 6 d 2 f. reduced by foot }
    measure is ——————— }

The sum added is ——— · —— 15s.

The half is 77 l. 14 s. the }
exact price of a square —— } 77 l. 14.

Use III.

*To find the exact price of 1 foot of Brick-
work at any price per Rod 272 foot
being a Rod, or the contrary, having
the true price of one foot, to find the
price of a Rod.*

ON the other half of the Rule, viz.
from 12 inches to 24 next the

hes, is set a scale of *equal parts* to 10
is the nd ;, neer 24 inches, whose use i thus,
bein At 4 d *per* foot of brick-work, what
f shi omes 272 foot to?

Seek 4 pence which is at the 4 on
for this scale, and just against it on the in-
ches is 4 *l.* 11 *s.* the price of a Rod, or
272 *f.* ¼. Note in this account every inch
is 1 pound, and every 8th part is 30d or
2 *s.* 6 *d.*

Again, at 5 *l.* 2 *s.* 6 *d.* *per* Rod, what
comes 1 foot to? Just against 5 inches
and ; counted in the inches, on the line
annexed is 4 *d.* 2 *f.* the exact price of
a foot of Brick-work. When the price
is above 12 pound *per* Rod, then call 6 *l.*
12 *l.* and 5 *d.* 1 *f.* against t 10 *d.* 2 *f.* and
you shall be resolved to 24 *l.* *per* Rod

B 5   Use

Use IV.

By the Line of Numbers and line of Pence in
annexed to work the former or any other
question in the Rule of Three or Pro-
Etice.

I.

At any price per 100 What cost 1 ?

1. FOR any price per 100 under 2 *s* or
co nt thus, seek the price in the
line of pence, and that is the exact an-
fwer to the Question.

Example, At 3 d. per 100 the price of
1 is ₃·₀ part of a penny into a hundred
parts.

Again, at 12 d. per hundred found
12 d on the line of penc ·, the Answer
12,100 parts of one penny, being need
half a farthing.

2. For any price per hundred between
2 s. and 10 l. per hundred, count thus

Count 1 at the beginning for 2 s.
in the middle for 1 l. and 10 at the end

or 10 *l.* Example, at 16 *s.* 8 *d.* per hundred what cost 1 ?

Note, if 1 at the beginning be 2 *s.* and in the middle 20 *s.* then 16 *s.* is at 8 neer the middle 1 and the 8 *d.* count 4 twelve parts forward on the line of Numbers: then just against it, on the line of pence is 2 *d.* the true answer required.

Again, at 2 *l.* 10 *s.* per 100 is 6 *d.* for 1.

3. From 10 *l.* to 1000 *l.* per 100, count thus, count the tens of pounds in the first part of the line of Numbers, and double it for so many shillings, and that is the answer in shillings.

Then count the unites of pounds and shillings and pence more on the line of Numbers, and right against it on the line of pence is the pence and farthings more to be added to the shillings first found out. Example,

At 72 *l.* 10 s. 6 *d. per square, What comes 1 foot to ?*

First, 7 the tens of pounds doubled

C   is

is 14 s. the answer in shillings, then 25, 25
the decimal of 2 l. 10 s. 6 d over sought
on the line of Numbers; just against it
on the line of pence is 6 d. o. f. 1 quar
in all 14 s. 6 d. o f. the exact answer
and price of 1 foot at 72 l. 10 s. 6 d per
square.

Again, at 325 l. *per square, what cost*
1 *foot?*

First, the double of 32 the tens of
pounds is 64 s. then just against 5 the
pound over sought on Numbers is just
12 d. in all 65 s. per foot at 325 l. per
100.

1. *On the contrary, the price of one foot*
being given to find the price of a square
or 100 *foot.*

Example, at 18 s. 7 d. 2 f. *per foot*
What comes a square to?

First, seek for 18 s. which is at 9 on
the first part of the line of Numbers, and
that 9 then stands for 90 l.

Then the odd 7 d. 2 f. sought out on
the line of pence on the numbers, right
against it is 31, 25 or 3 l. 2 s. 6 d. in all

93 *l.* 2 *s.* 6 *d.* per square, the exact answer.

Again, at 7 *l.* 5 *s.* per foot, what cost 100?

In 7 *l.* is 140 *s.* to which adding 2 Cyphers makes 14000 *s.* or 700 *l.* then adding two Cyphers to 5 *s.* make 500 *s.* or 25 *l.* in all 725 *l.* the price of one square at 7 *l.* 5 *s.* per foot.

2. For all Rates under 2 *s.* per foot, seek the price in the Line of Pence, and in the numbers just over is the price of the square required.

Example, At 18 *d.* per foot, the price of the square or 100 foot is 7 *l.* 10 *s.*

Note, These pence and farthings read on the line of Numbers, are only the Decimals of those pence and farthings, 1 *l.* being the Integer, which you must conceive to be a Radius or Revolution further beyond 10 at the end; thus the Decimal of 4 *d.* 2 *f.* is 0,01875.

The Decimal of 3 half pence is 0,00625.

The Decimal of 3 *s.* 6 *d.* is 0,175.

C 2   Use

Use V.

The use of the Line of Numbers in several Rules, as Multiplication, Division, Reduction, Rules of Three, &c.

I. *Multiplication by the Line of Numbers.*

IT is supposed, that the way of reading the Line is well known already, not, consult the Carpenters Rule, or the first Chapter of the Triangular Quadrant: in brief thus, if 1 at the beginning be called 1 Integer, then 1 in the middle is 10 Integers, and 10 at the end is 100 Integers, and the cuts betwen the Decimal, Centessimial and Milessimial parts between, as the room will allow.

In Multiplication 1 is alwayes the first term, the Multiplicator (or Multiplicand

plicand the second, it matters not which,
but most properly the Multiplicator) the
second, the Multiplicand the third, and
the Product the fourth.

The Operation alwayes thus,

The extent from 1 to the Multipica-
tor being laid the same way from the
multiplicand shall reach to the Pro-
duct.

Example, Let 125 be multiplied by
75, the extent from 1 to 75 being laid
the same way from 125 will reach to
9375.

Thus for any other sum, but note
that to 4 Figures is as many as you can
see on most Lines of Numbers.

But to know the certain Number of
Figures, there is for the most part as
many in the Product as in the Multipli-
cator and Multiplicand both added;
and sometimes 1 less, which is, when
the first Figures of the Product are grea-
ter, then the two first Figures of the
Multiplicator, or Multiplicand.

2. Note also, when the Product con-
sists

sists of more than 4 figures, to justifie
the last, use this help; set down the
Numbers as if you would multiply it by
the Pen, then with Inke or Chaulk be-
gin to multiply the Numbers as in the
Example; suppose I were to multiply
168 by 249.

Then by the first note I know I must
have 5 or 6 figures in the Product.

Then to justifie the two or three last
figures, the Numbers
being set down,
begin to multiply,
saying, 8 times 9 is
72, set down 2 and
carry 7; again, 8
times 4 is 32 and 7
is 39.

$$
\begin{array}{r}
2\,4\,9 \\
1\,6\,8 \\
\hline
1\,9\,9\,2 \\
1\,4\,9\,4 \\
9 \\
\hline
8\,3\,2
\end{array}
$$

Again, 6 times 9 is 54, set down 4,
and carry 5, 6 times 4 is 24 and 5 is
29.

Lastly, if you will, once 9 is 9, then
those three first Figures added are 832.

Then the extent from 1 to 168 being
laid

laid the same way from 249, gives 418 plainly, and the 32 is justified by the second note and number of figures, *viz* 5 and not 6, is because in 41832 the Product 41 is more than 24, or 16, the two first Figures of the multiplicator, or multiplicand ; by well heeding, and frequent practice this will be ready to any ordinary capacity.

3. In Multiplication of whole Numbers, and Fractions, or Fractions only; it is all one by the line of Numbers as *whole* Numbers, and for the Fraction of a Pound *Sterling*, or the Pence in a Shilling, or the Inches in a Foot, they are exprest in Pricks as much as needs, as you will fully see in Rules of Practice.

4. *Note*, That as Multiplication of Integers do increase, so Multiplication of Fractions do decrease and become less then 1, for once 1 is but one ; therefore less than 1 multiplyed by less then 1 must needs be less then 1.

Of

Use VI.

Of Division.

1. IN *Division* the Divisor is always the first term, and 1 the second; the Dividend the third, the Quotient the fourth: *Example*, let 523 be divided by 17.

2. The extent from 17 to 1 shall reach the same way from 523 to 30, and 764, of 1000 the true Quotient and Decimal Fraction required, which Decimal Fraction if you would reduce to the Vulgar Fraction found by the Pen, then say the same extent of the Compasses the contrary way, from the Decimal Fraction last found and it gives 13,17 the remainder found by the Pen.

For first the extent from 17 to 1, laid the same way from 523, gives 30 for Integers, in the Quotient, and 764 more, as a Decimal Fraction.

Lastly,

Lastly, the same extent laid the contrary way from 764 the decimal Fraction gives 13 the Numerator of 17 the vulgar Fraction found by the Pen.

3. If you divide Mixt Numbers, *viz.* Integers and Fractions, by Integers and Fractions, or divide lesser Numbers by greater, is as easie by the Line as Integers only ; especially, using the line of 8 Radiusses, which doth insure you of the number of places.

Example,

Let 17 s. 6 d. be divided by 7,5, as among 7 Men and a Boy, counting the Boy half pay.

The extent from 7,5 to 1, laid the same way from 17,5, shall reach to 2,333 each mans share, the half of 2,333, *viz,* 1, 1666 being the Boyes share; for if 2,333 be multiplyed by 7, the Product is 16,333 to which adding 1,166 the sum total is near 17,5

4. Or by the Line of Pence and Farthings thus, with the Line of Numbers

The

Use VI.

Of Division.

1. IN *Division* the Divisor is alwayes
the first term, and 1 the second;
the Dividend the third, the Quotient the
fourth: *Example*, let 523 be divided
by 17.

2. The extent from 17 to 1 shall
reach the same way from 523 to 30, and
764, of 1000 the true Quotient and De-
cimal Fraction required, which Decimal
Fraction if you would reduce to the
Vulgar Fraction found by the Pen, then
say the same extent of the Compasses
the contrary way, from the Decimal
Fraction last found and it gives 13,17
the remainder found by the Pen.

For first the extent from 17 to 1, laid
the same way from 523, gives 30 for
Integers, in the Quotient, and 764 more,
as a Decimal Fraction.

Lastly,

Lastly, the same extent laid the contrary way from 764 the decimal Fraction gives 13 the Numerator of 17 the vulgar Fraction found by the Pen.

3. If you divide Mixt Numbers, *viz.* Integers and Fractions, by Integers and Fractions, or divide lesser Numbers by greater, is as easie by the Line as Integers only ; especially, using the line of 8 Radiusses, which doth infuse you of the number of places.

Example,

Let 17 *s.* 6 *d.* be divided by 7,5, as among 7 Men and a Boy, counting the Boy half pay.

The extent from 7,5 to 1, laid the same way from 17,5, shall reach to 2,333 each mans share , the half of 2,333, *viz.* 1,1666 being the Boyes share ; for if 2,333 be multiplyed by 7, the Product is 16,333 to which adding 1,166 the sum total is near 17,5.

4. Or by the Line of Pence and Farthings thus, with the Line of Numbers

The

The extent from 7,5 on the Numbers
to 1, shall reach from 17 s. 6 d. to 2 s.
4 d. each man's share, the half of which
viz. 1 s. 2 d. is the Boyes share.

Example, Of a lesser Number to be
divided by a greater. If 2 l. 6 s. 10 d.
is to be divided among 52 men, and to
allow one eighth part for the Clerk, how
much is each mans share ?

The extent from 52 one 8th. to 1
counted on the Line of Numbers, shall
reach from 2 l. 6 s. 10 d. counted on
the Numbers, to 10 d. 3 farthings, the
answer on the Line of Pence.

5. The number of Figures in any Quo-
tient, is as many as the figures of the
Dividend exceed the figures of the Di-
visor, and one more, when the first fi-
gure of the Dividend is greater than the
first of the Divisor.

Use

Use VII.

Of Reduction.

THE general Rule is, As one Deno-
minator to the other Denomina-
tor; so is one Numerator to the other:
Example, To reduce Ounces to a De-
cimal Fraction, as 16 to 1000 so is 12
Ounces to 750, the Decimal Fraction
required.

But Inches and Deicmalls, Pounds and
Decimals are reduced by the Lines of
Inches and Foot Measure, and by the
Line of Numbers, and Line of Pence
by inspection only; for if you would
have a Decimal for 15 *s.* 6 *d.* read thus,
15 *s.* is 75, and just against 6 *d.* in the
Line of Pence on the Line of Numbers
is 025, in all ,75,25. And on the con-
trary, 7 double is 14 *s.* and 5 the next
figure, the half of 1 in the sixth, place
is 1 *s.* and 25 a quarter of 2 *s.* *viz.* 0,1
is

is 6 d. the ready Reduction required

Use VIII.

To find the Square Root of a Number, being a Geometrical mean Proportion between it and 1.

1. **F**Irst consider, whether the Number consists of even or odd Places, *viz.* of 2, 4, 6, or 8 places, or 1, 3, 5, or 7 Places.

2. It is convenient to set the number down in Ink or Chalk, and Point it, as in the Example, to find the true number of Places in the Root ; for look how many Points, so many places in the Root.

3. When the Number of places are even, then the Unite or 1 is counted at the right end ; when 10 is usually set, and the Number and Root read toward
    the

the left hand. But when the number
of Figures or Places be odd, then the
Unite is to be accounted at 1 on the
left end, and the Root and Number
counted forward toward the right
hand.

Example, To find the Square Root
of these two Numbers, *viz.* 8464 and
17424, first Point them as in the Exam-
ple, at the first, third and fifth place,
being read from the Unite or right hand,
then first for 8464 consisting of even
places, the exact middle, between 10
at the right end, and 8464 counted left-
ward, will be found at 92 the Square
Root, and because the Number is Poin-
ted with two Points, it consists of two
places of Integers.

Again, for 17424 a number of odd
places and three Points, the left hand
or middle 1 is the Unite, and the Root
and Number counted toward 10 for-
ward.

The exact middle between 1 and
17424, read as neer as you can, will be

at 132, of 3 places, because the Number had 3 Points.

These Rules are as to the Integers, the Fractions are Decimals.

Use IX.

Of the Cube Root.

The Cube Root is the first of two mean Proportions Geometrical between 1 and the Number given; found thus,

1. First set the Number down and point it at the first, the fourth, the seventh, and tenth Place counting from the Unite or Right hand toward the Left. And note, how many Points, so many Figures in the Root.

2. When the Point falls on the last Figure, then the Middle 1, or Left hand 1 is the Unite, and the Root and Cube counted forward toward 10.

3. When

3. When the point falls on the last but one, then the Unite may be at either end, as at 1 at the beginning, or left end, or at 10 at the right end; but the Cube will be in a Radius and more beyond 1 either forward or backwards, so that to work it, the numbers must be here repeated as is usual.

4. But when the Point falls on the last Figure but two, then 10 at the right end is the Unite, and the Root Square and Cube is found all backward, in the same Radius, *viz.* between 10 and the middle 1.

Example, in these three Numbers,

1. A third part between 1 and 5832 is 18 the Cube Root required, found between 1 and 10.

2. A third part between 1 and 32768 is at 32 the Cube Root found in the same Radius beyond 1 forward, or behind 10 backward; but the number is counted in a Radius beyond 1 forward, or behind 10 backward.

3. A third part between 10 and

474522 is at 78, between 10 and the middle 1 backwards.

Use X.

Of the Rule of Three.

IN Questions of the Rule of Three, the chief difficulty is in stating and understanding the Question, to Methodise it well ; as thus, to find out the first, second, and third Terms ; which may be done thus.

1. In all Questions of the Rule of Three, three Terms are given and a 4th, demanded : of the three given Terms, two are of supposition and one of demand or enquiry, being always the third Term.

2. Of the three Terms, two are of one Denomination, and one of another; (or are made so by Reduction)

3. Always the Term of Demand is the

the third Term, (in Direct Proportion)
to one of the other Terms of Suppositi-
on, *viz.* that of the same Denominati-
on with the third Term, is the first
Term; then the other left must needs
be the second; the answer to the De-
mand the fourth Term.

4. This being premised, the General
Rule by the Line of Numbers is,

The extent of a pair of Compasses
from the first Term to the second, coun-
ted on a Line of Numbers, shall reach
the same way, on the same Line of Num-
bers, from the third Term to the
fourth.

1. *Example*, If one foot of **Timber**
cost 10 *d.* what cost 35 foot? The ex-
tent from 1 at the beginning to 10
counted at the middle 1, shall reach the
same way from 35 counted in the first
part, to 350 Pence counted in the se-
cond part.

2. Again, to bring 350 pence to Shil-
lings,

The extent from 12 to 1, shall reach
the

the same way from 350 to 29 *s.* 2 *d.*

3. Or using the Line of Pence, The
extent from middle 1 on the Line of
Numbers to 10 *d.* in the Line of Pence,
shall reach on the Numbers from 35 to
1 *l.* 9 *s.* 2 *d.*

The Reverse and Double Rule, or
Compound Rule of Three, by the Line
of Numbers, are of no account, for the
Reverse Rule, by altering the state of
the Question, may be reduced to the
Direct Rule; and two single Rules
wrought sooner then the Numbers
shall be prepared for the Compound
Rule; but of them may you see more
in sheet K of the Triangular Qua-
drant.

Use XI.

Of the Rule of Practice.

THis Rule is only the Rule of Three variously applied, wherein the naming the Question requires more words than the working and the great care in stateing, whereby the reason of the Rule may appear, as is well set forth in Page 285 of Mr. *Kerseys* Arithmetick.

But these Rules of Practice by the Line of Numbers, so far as the Line will express, are wrought without such burthen to the Memory, any more than needs to understand the Question; as in these several Examples,

1. If one Yard or Pound cost 3 *d.* what cost 36 Yards? Answer, 108 Pence.

For the extent from 1 to 3, shall reach from 36 to 108 pence.

Or the extent from 1 on the Line of

Numbers to 3 d. on the Line of Pence, being laid the same way from 35, shall reach to 45 or 9 s. 100 being 20 s. or one Pound, as is made plain in Use 4th.

2. If 3 and 3 quarters of any thing shall cost 7 d. 3 far. what cost 39¾ of the same Commodity? Answer, 6 s. 9 d. 3 f. for the extent from 3,75 to 7 d. 3 f. on the Line of Pence, being laid the same way from 39,50 gives 3,410.

Note, The 3 reduced is 6 s. then 410 counted on the line of Numbers, just against it on the Line of Pence is, 9 d. 3 farthings.

3. If 112 Pound cost 28 s. what cost 1 l? The extent from 112 to 1 l. 8 s. counted on the Line of Numbers, laid the same way from 1 on Numbers, gives 3 d. on the Line of Pence.

4. If 1 l. cost 5 d. 2 f. what cost 112? The extent from 1 to 5 d, 2 f. being laid from 112, gives 2 l. 11 s. 4 d.

5. If 112 l. cost 2 l. 10 s. 6 d. what cost 21 C. 3 q. 12 l. Answer, is 55 l. 4 s. 0 d for the extent from 112 to 2,525 being

...eing laid the same way from 2448 the
...ounds, in 21 C. 3 q. 12 l. shall reach to
...5 l. 4 s.

Or the extent from 1 to 2,525 being
...id the same way from 21,86 shall reach
...o 55 l. 4 s. as before.

6. If 5 Ounces ½ cost 20 d. 3 f. what
...ost 1 C. 1 q. and 15 l? The Answer is
...9 l. 2 s. 10 d. wrought at twice, thus,

1. The extent from 5 ½ to 20 d.
...3 f. laid the same way from 16 the
...ounces in 1 l. gives 2518, or 5 s. 0 d. 2 f.
...ear.

2. The extent from 1 to 2518 be-
...ing laid from 155 the pounds is 1 C.
...1 q. and 15 l, to 39 l. 2 s. 10 d.

Use

Ufe XII.

For meafuring Board *or any* Superficial Meafure.

1. AS 12 to the Inches broad, fo is the length in feet to the Content in feet ; or as 1 to the breadth, fo is the length to the Content in Foot Meafure.

Example, At 8 Inches broad and 20 Foot long, the Anfwer is 13 Foot 4 Inches.

2. As the breadth in Inches to 12, fo is 12 to the Inches that make 1 Foot.

Or as the breadth to 1, fo is 1 to the length of a Foot in Foot meafure.

3. As 1 Inch to the breadth in Inches, fo is the length in Inches, to the Content in Inches.

Or

Or as 144 to the breadth in Inches, so is the length in Inches, to the Content in Feet.

Or by Foot Measure, as 1 Foot to the length in Feet and Parts, so is the breadth in Feet and Parts, to the Content in Feet and Parts.

4. To measure any Triangle Figure.

As 2. To the whole Perpendicular, so is the whole Base of any Triangle, to the Superficial Content in like measure.

5. All Irregular Figures are best and easiest measured when reduced to Triangles or Trapesiaes, and then cast up as Triangles or Parralelograms, as just before.

6. To find a Square equal to any long Square, divide the space on the line of Numbers, between the length and breadth, into two equal parts, and the middle shall be the side of the square equal to that long square.

Example, Let a long Square be 4 foot broad and 9 foot long, the mid-
dle

middle between 4 and 9 on the Line
of Numbers will ſtay at 6, and 6 is the
ſide of a Squ2re equal in Area to a long
Square of 9 foot one way and 4 foot the
other ; for 4 times 9 is 36, and 6 times
6 is 36 alſo.

Uſe XIII.

To Meaſure Solid Meaſure.

1. THE middle between the breadth
       and thickneſs , is the ſide of a
Square equal.

2. The ſide of the ſquare equal be-
ing known, to find how much in length
makes one foot of Timber.

The extent from the ſide of the
Squ2re to 1. being turned twice the
ſame way from 1, ſhall reach to the
length required to make a foot of Tim-
ber in foot Meaſure.

Or the extent from the inches Square
                                    to

to 12, being turn'd twice the same way from 12, shall reach to the inches in length to make a foot of Timber.

Example, At 50 of a foot in 100 or 6 inches Square.

The extent from 5 to 1, being twice repeated from 1 reaches to 4, for 4 foot.

Or the extent from 6 to 12 being twice repeated from 12, shall reach to 48 inches the length in inches required.

But if the Timber or Stone be not Square or Squared, then say,

As 12 to the breadth in inches, so is the depth in inches to a fourth :

Again, as the fourth is to 12, so is 12 to the length required in inches, to make one foot of Timber.

Example, At 9 and 4 inches broad and thick.

The extent from 12 to 9 shall reach the same way from 4 to 3, a fourth.

Again, the extent from 3 the fourth to 12, shall reach from 12 to 48, the

D   inches

inches in length to make 1 foot.

The same work serves for foot Measure using 1 instead of 12.

3. *The side of the Square, or the breadth and depth given, to find how much is in 1 foot long; 3 wayes.*

1. As 12, or 1, to the side of the square in inches, or foot measure, so is the side of the square, to the quantity in a foot long required.

2. The extent from 1 to 9 inches the breadth, shall reach from 4 the depth to 36 the long inches in a foot long.

3. The extent from 12 to 4 the depth, shall reach from 9 the breadth to 3 twelfth parts of a foot of Timber, the quantity in a foot long at those dimentions of breadth and depth.

4. *The side of the square and length in feet given, to find the Content in feet.*

The extent from 12 to the inches square, being twice repeated from the length in feet gives the content in feet.

Or

Or the extent from 1 to the side of the Square in foot measure, being twice repeated from the length in foot measure, gives the content in foot measure.

Or if the Timber be not Square or squared, say,

As 12 or 1 to the depth, so is the breadth to a fourth.

Again, As 12, or 1 to the fourth, so is the length to the content required.

Example, at 15 inches deep, and 18 inches broad, and 13 foot long.

The extent from 12 to 15, shall reach from 18 to 22,50:   Again,

The extent from 12 to 22,50, shall reach from 13 to 24 foot 38 parts, or 4 inches and a half the Content.

5. In measuring of Taper Timber, to the content found by the middle Square or girt, add a piece, the side of whose square shall be half the difference of the squares at each end, and the length one third part of the whole length, and those two sums shall be the true content.

D 2   Use

Ufe XIV.

For Round Timber.

1. **A**T any Diameter given, to find how long makes one Foot:
The extent from the Diameter to 46 90 being twice repeated from 1 gives the length to make a foot of Timber in inches.

Or the extent from the Dtameter to 13, 54 being twice the fame way from 12, fhall reach to the inches long to make a foot.

2. At any Diameter given, to find how much is in a foot long.

The extent from 13.54, to the Diameter in inches, being twice repeated from 12, gives the quantity in 1 foot long, in inches.

But for great Timber fay, fo is 1 to the Content of 1 foot long in feet and parts.

3. The

3. The Diameter given in inches, and the length in feet, to find the whole Content in feet.

The extent from 1 3,5 4 to the Diameter being twice repeated from the length in feet, gives the solid Content in feet.

If you work by the Circumference there the Center used is 1 3 4, 5, the inches about, when one foot long makes a foot.

D 3   Use

Use XV.

Of a Circle.

*For the ready Measuring of a Cir-
cle and its parts use these Centers
by the Line of Numbers*

Diameter.------ ------ 10 --- 0
Circumference-- ------ 31 ---42
Square equal --- ---- 8--862
Square within------ ----7--071
Area of a Circle ---- 78 --- 54
Area of a Semicircle-- 39-- --27
Area of a Quadrant -- 19 — 635

THE use of these Points is thus,
Having any one of these given, to
find the rest.

The extent from 10 the fixed Dia-
meter, to the given Diameter, laid the
same way for the fixed Circumference
reaches

reaches to the Circumference required.

But for Area's of Circles, half Circles, or quarters, you must turn the Compasses twice.

Example, The extent from 10 to 30, being repeated twice the same way from 78.54 gives 707, the Area of a Circle whose Diameter is 30.

If the Area's be given, and a side quired, the half distance between the Area's, laid from the Centers, for the side given, gives the reciprocal inquired side.

Example, The half distance between 707, and 78.54, laid from 30 gives 10, or from 10 gives 30, for the Diameters required.

For an Oval or such like Figure the middle between the Transvers (or longest) and Conjugate (or shortest) Diameters, measured on the line of Numbers, gives the Diameter of a Circle equal to the Oval.

For

For a Sphear or Globe.

THE Diameter and Circumference is
found as that of a Circle is; the su-
perficial and solid content find thus,

The extent from 1 to the Diameter
being twice repeated from 31,42 shall
give the Superficies round about.

And the extent from 1 to the Diame-
ter being thrice repeated from 523,6
shall reach to the Solid Content requi-
red.

Example, At 30 inches Diameter,
As 10 to 30, so is 31,42 twice to
2827--8.

As 10 to 30 so is 523,6 thrice to
14145 the Solid Content of a Globe
of 30 Inches Diameter, in like Solid
Cube Inches.

To measure a Segment of a Globe.

As 1 to the Segments Diameter, so

is half the Altitude twice to the Solid Content neer.

In measuring Taper Timber find the difference of the Squares at each end, then to the Content found by the middle Square or Diameter add another piece, whose side of the Square is half the difference of the two Squares, and whose length is 1 third part of the whole length.

A Solid Oval reduce to a Globe by a mean between the Transverse and Conjugate Diameters, as before in the Superficial Oval.

Use XVI.

Of Gauging.

Gauging is the measuring of any Solid Body, or Vessel, and giving the quantity in Gallons, Wine or Ale Measure, or in Beer, or Ale Barrels, or any

any other greater or leſſer quantities, and for ſeveral forms of Cask, are ſeveral meet Rules and Proportions for operation; ſome of the moſt uſeful are here inſerted.

A wine gallon contains 231 Cube
An ale gallon 288 or 282 inches
An ale barrel 9216 or 9024 which
A beer barrel 10268 or 10152 ſerve
A corn gallon 272½ as Diviſon.
A corn buſhel 2178

Of Gauge Points for theſe Meaſures both for round, and alſo for ſquare Veſſels.

Names of the Gallon Veſſels		G. P. Round	G. P. Square
Gallon	Wine	17—19	15—199
	Corn	18—52	16—500
	Ale at 282	18—95	16—792
	Ale at 288	19—15	16—472
Corn Buſhel 272 1,4 h		52—66	4—568
Ale Barrel at 282		107—20	95—036
Beer Barrel at 282		113—69	100—758

The

The Gauge Points for round Veſſels, are the Diameters of thoſe Circles whoſe Area's are equal to the Cube Inches in thoſe meaſures.

The Gauge Points for Square Veſſels are Square Roots of thoſe Numbers of Cube Inches in each Veſſel, or Meaſure, as Gallon, Buſhel or Barrel.

The uſe of thoſe Diviſors and Gauge Points are briefly thus,

Having multiplied the length in inches, by the breadth in inches, and then that Product by the inches deep, this ſecond Product divided by the Cube Inches contained in any Veſſel, gives the anſwer to your queſtion required.

Or more briefly by the Gauge Points, Example, both for ſquare and round Veſſels; and first Square,

The extent from the Gauge Point to the length, laid the ſame way from the breadth, gives a fourth. The

The extent from the Gauge Point to the 4 laid the same way from the depth, gives the Content in Gallons, Bushels, or Barrels, as the Gauge Point was.

But if the Vessel be square or squared, say; As the Gauge Point to the side of the Square, so is the depth twice to the Content in like measure.

Example, The Equated Diameter of any round Vessel being 28,1 and the length 40 inches, the Content will be 107,54 Wine Gallons.

The same manner of operation serves to use any other Gauge Point, either for square or round Vessels; how to come by the Equated Diameters, consult other Books of Gauging, or Experience, as in the *Triangular Quadrant* is more at large explained; in brief, That as 10 to 7, or 6,9, 6,8, 6,7, 6,6, or 6,5. as Experience guides; so is the difference of Diameters to a fourth to be added to the lesser Diameter.

Use

Ufe XVII.

To meafure Brick-work, and reduce it to Brick and half at one Operation.

FOR this purpofe there are Points fet for half a Brick, 1 Brick, 1 ½, 2, and 2 and ½, and 3 Bricks at 30, 15, 10, 7,5, 6, and 5 ; and ufed thus.

The extent from 30 to the breadth, fhall reach from the length of any Wall half a Brick thick, to the Content of at a Brick and a half thick.

Example, at 12 foot high and 20 foot broad at 6 thickneffes.

The

Foot

The extent from				being				Foot
30	10½			being			80	
15	1	to		laid			160	
10	2		12	the		20	240	
7½	2½			same		give	320	
6	3			way			400	
5	Brick			from			480	reduced to a Brick & half thick

To reduce any Number of Feet, to Rods, Quarters, and Feet, at one sitting.

The extent from 272 one quarter to 1, being laid the same way from the Numbers of Feet reaches to the Rods and quarters, and decimals over; then the same extent, laid the contrary way from the decimal Parts more than a Rod or quarters, give the Number of odd feet over.

Example, *in 2578 feet, how many Rod, Quarters and Feet?*

The extent from 272¼ to 1 being laid the same way from 2578 gives first 9 Rod and a quarter, and the Decimal

Parts

Parts over are 22, then the same extent laid the contrary way from 22, gives 60 the odd feet over.

Then for the price of the whole or part; As 272 ¼ to 5 *l.* the rate of Rod; so is 2578 feet to 47 *l.* 7 *s.* the price of the whole, or so is the odd 60 foot to 1 *l.* 2 *s.* the like for any other.

Use XVIII.

To Measure digging by solid Yards.

1. **A**S 1 to the breadth, so is the length to the superficial Content in feet.

2. As 1 to the Content in Superficial feet, so is the depth to the content in Solid feet.

3. As 27 the feet in 1 Yard, to 1 ; so is the Content in Solid feet, to the Content in Yards.   *Or*

Or shorter thus,

1. As 9 (the number of superficial feet in a superficial yard,) to the length in feet; so is the breadth in feet to the content in superficial Yards.

2. As 3 (the depth of one yard) to the content in superficial yards; so is the depth in feet, to the content in solid yards.

Example, *At* 20 *foot long,* 18 *foot broad, and* 8 *foot deep, how many yards of Earth?*

1. The Extent from 9 to 20, reaches from 18 to 40 the superficial yards.

2. The extent from 3 to 40 reaches from 8 the depth to 106 $\frac{2}{3}$ (or 18 foot) the true content in yards or loads of Earth.

Use

Use XIX.

Of Simple Interest.

1. HAving the Rate of Interest for 100 *l.* to find the Interest due for a greater or lesser sum for one year.

As 100 *l.* to 6 *l.* 7 *l.* or 8 *l.* the rate due for 100 *l.* in a year; so is any other sum to its Interest due in 1 year.

Example, *As* 100 *to* 6, *so is* 124 *l.* *to* 7 *l.* 8 *s.* 9 *d.*

2. For Moneths reckon thus, if 6 be 12 Moneths (or 6 *l.* the Interest for 100 *l.* in 12 Moneths) then 9 is 18 Moneths, 12 is 24 Moneths, *&c.*

Thus the Interest of 30 *l.* in 18 moneths comes to 2 *l.* 14 *s.* for the extent from 100 to 9 reaches the same way from 30 to 2 *l.* 14 *s.*

3. To

3. To find Principal and Increase, or the present worth of any sum for any time.

Count thus, The middle 1, a 100 *l.* and 6 tenths further for 106 the principle and increase of 100 *l.* in one year, 112 is for 2 years, 118 for 3 years, 124 for 4 years : thus every tenth is 1 moneths : so that for 7 years count thus, 7 times 12 is 84, whose half 42, or rather 142, is the Point for 7 years.

Example, *what is the increase and principal of* 30 *l. in* 5 *years and* ½ ?

The Extent from 100 to 133 laid the same way from 30, reaches to 39 *l.* 18 *s.* the increase and principal at Simple Interest.

But if the same extent be laid decreasing from 30, it gives but 22 *l.* 11 *s.* being the present worth of 30 *l.* due 5 years and a half to come, at Simple Interest at the rate of 6 *l. per Cent. per Annum.*

4. For any number of dayes work thus,

1. As 365 the dayes in 1 year, is to the

the rate of Interest due for 100 *l*. in 365 dayes. so is any other number of Dayes to the Interest due for 100 *l*. at the end of those dayes.

2. As the Sum last found with 100 added to it, is to 100, so is the sum propounded to his present worth ; or if you turn the other way to his increase.

Example, *What is the present worth or increase of* 148 *l. in* 5 *years, at* 8 *per Cent ?*

1. As 365 to 8, so is 1825 (the Dayes in 5 years) to 40 *l*. the Interest due for 100 *l*. in 5 years at 8 *per Cent.*

2. As 140, (the Sum last found and 100 added) to 100, so is 148 the Money due at 5 years end, to 105,7142 the present worth.

Or if you turn the same extent the other way, to 207 *l*. 12 or 2 *s*. 5 *d*. the increase of 148 *l*. in 5 years time, at Simple Interest at 8 *per Cent.*

5. As for Equation of Payments in brief thus,

As

As the Sum of the present worth, to pay presently, to the Sum of the payments to be paid in time, so is 1 to a 4th number; from which number when 100 is substracted, remains the Interest of 1 *l.* for the time sought, which divided by 00016438, the Quotient is the Answer.

Example, *If* 120 *l. be agreed to be paid by* 40 *l. at* 3 *Moneths end, at how many dayes end ought it to be paid at once to allow Interest for the present payment?*

The 3 present worths come to 116 *l.* 521.

Then as 116,521 to 120, so is 1 to 102,98; from which taking 100, or 1 in the place of a 100, rest 02,98, the Interest of 100 *l.* the time required.

Lastly, The extent from 00016438 to 1 laid the same way from 02,98, gives 181 $\frac{1}{3}$ the number of dayes required; wherein the 120 *l.* ought to be paid all at once, to allow Interest at 6 *per Cent.* to both.

As

As for increase and present worths
of Annuities at Simple Interest, I re-
fer you to a Discourse by it self, with
ample and exact Tables both for Sim-
ple and Compound Interest ready for
the Press, by *I. B.* and *E. H.*

Use XX.

Of Compound Interest.

ANy Sum of Money put out for
time, to receive at last Com-
pound Interest, to find the increase of
Use and Principle at the time limited
in years only.

The extent from 100, to the Prin-
ciple and the increase of 100 *l.* in one
year, being repeated so many times from
the Sum propounded, as there be years
in the Question ; shall stay at the An-
swer to the Question required.

Example,

Example , *What is the increase of* 30 *l*. 10 *s*. put out for 5 years end, *to receive Compound Interest at the end of* 5 *years*, *at* 6 *l*. per Cent per Annum

The exact extent from 100, to 106 being repeated 5 times from 30 *l*. 10 *s*. gives 46 *l*. 17 *s*.

2. *To do the like for Moneths*,

Let the space between 100 and 106 on the Line of Numbers be divided into 12 equal parts; then thus,

The Extent from 100 to the Number of Moneths propounded, shall reach from the Sum to the Principal and Increase at the end of those Moneths (or dayes) propounded.

Example, *What shall be the increase* of 125 *l*. in 9 *Moneths* ?

The extent from 100 to 9 Moneths, being laid the same way from 125 *l*. gives 130 *l*. 11 *s*. 9 *d*.

3. To do the same when many years and Moneths are propounded, you must use a Scale of equal Parts whereby the Line of Numbers was made, and use it thus,   Dayes

Dayes Log.	Months Logar.	Years Logar.
1, 00006928	1, 00210882	1, 02530586
2, 00013857	2, 00421764	2, 05061173
3, 00020786	3, 00632646	3, 07591759
4, 00027713	4, 00843528	4, 10122346
5, 00034642	5, 0105411	5, 12652932
6, 00041571	6, 01265293	6, 15183519
7, 00048498	7, 01476176	7, 17714105
8, 00055431	8, 01687057	8, 20244692
9, 00062360	9, 01897993	9, 22775279
10, 00069281	10, 02108822	10, 253 5865
11, 00076215	11, 02319704	11, 27836452
12, 00083141	12, 02530586	12, 30367038

These Numbers, are the Logarithmes
of 12 Dayes, 12 Moneths, and 12 Years,
wherewith by **Addition**, or Multiplica-
tion, you may gain the Logarithme of
any number of Years, Moneths and
Dayes whatsoever, and the Sum when
added

added and taken from the Scale of
equal Parts , and laid from the Sum
propounded , give the increase of the
Principal and Interest in the time pro-
pounded at 6 *per Cent.*

Example, *If* 53 *l.* 5 *s.* *be put out to*
Use for 15 *Years,* 9 *Moneths, and* 17
Dayes, what is the increase?

The Log. of 10 years is —,2530586 5
The Log. of 5 years is —,1265293 2
The Log. of 9 moneths is--,0189799 3
The Log. of 10 dayes is—-,0006928
The Log. of 7 dayes is—-,0004849
The Sum of the Log. is·--,3997456

Being the Logarithme of 15 Years,
9 Moneths, and 17 Dayes.

This extent taken from the Scale of e-
qual Parts and laid increasing from 53 *l.*
5 *s.* gives 133-- 13 *s.* for the Principal
and increase of 53 *l.* 5 *s.* in 15 Years
9 Moneths, and 17 Dayes , at 6 *p*
Cent. Compound Interest.

2. T

2. *To find the Decrease, Rebate, or present Worth of any Sum for any time at 6 per Cent.*

The operation is the same as for the increase, only to be laid backward or decreasing from the Sum propounded, as the other was laid increasing; as in the last Example, the extent of the Compasses taken, from 0 of equal parts to 39974, laid on the Line of Numbers from 53 *l.* 25 *s.* decreasing, gives 21 *l.* 4 *s.* 6 *d.* the present worth of 53 *l.* 5 *s.* due 15 years, 9 moneths, and 17 dayes to come, at 6 *per Cent.* Compound Interest.

3. *To find the Increase, or present worths of Annuities at 6 per Cent.*

First find what Sum of Money it is that hath the Interest thereof equal to the Annuity or half year, or quarterly Payment in a year, half year, or

E   quarter,

quarter; then by the former Rule, find the increase of that Sum, in the time propounded, and from the Sum subtract the first found Principal, and the remainder is the increase required.

Example, *Suppose the Annuity be 10 l. per Annum, and continues for 21 years, what is the increase at 21 years end, and the present worth in ready Money) when to gain at 6 per Cent.*

First, as 6 to 100, so is 10 to 166, 666, for a Principal whose Interest is 10 l. per Annum.

Then the Logarithme of 1 year at 6 per Cent. viz. 0253o606 multiplied by 21 is 5314232; which taken from equal Parts, and laid from 166,666 increasing, gives 566,666 for the Principal and Arrears in 21 years; from which taking 166,666 remains 400 l. for the answer as Increasing.

Then the same extent laid decreasing from 400, gives 117 l. 12 s. the Present

sent worth of 10 *l. per Annum*, to continue 21 years to gain at 6 *per Cent.*

For other Rates make other Logarithmes, Tables for Years, Moneths and Dayes.

Use XXI.

Of the 30 *and* 40 *Scales.*

1. FIrst it is a fixed Scale of 30 foot, divided to every foot and inch from 1 to 30.

2. The Scale to 40 foot is the like, where every foot is numbred, and every 2 Inches expressed, from 1 foot to 40 foot.

3. The 30 Scales are very fit in Architecture, for large or small Draughts; as thus,

1. In large Draughts, let 30 represent half a Model, then every foot is

E 2   one

one Minute, and every inch one twelfth
part of a Minute.

2. In moderate Draughts, the whole
Scale to 30 may reprefent 3 Models,
then every foot is 6 Minutes, and every
Inch is half a Minute.

3. In fmall Draughts, let every foot
reprefent 1 Model, then every Inch is
5 Minutes, for 12 times 5 is 60, the
Minutes in 1 Model.

Thus the 30 Scales, may conveni-
ently ferve for greater, or leffer Scales,
by opening and fhutting the Lines
Sector-like.

4. The meaning of Four Terms
in the following Ufes, ufed for brevity
fake, *viz. Lateral, Parallel, Common
Line*, and *Neareft diftance.*

1. *Lateral* , is any diftance or ex-
tent taken from the Center or be-
ginning of any Line, along the Line
to the part required on one Line only.

As the *Lateral* extent of 10 foot, is
the meafure from the Center to 10 foot
on any one of the 30 Scales, or on the
Scal-

Scale to 40, or in like manner on the
Lines of Chords or Tangents, from
the beginning to any Number or Point
required.

2. *Parallel* is the extent taken across
from one Leg to another, as from 30,
on one Leg, to 30 on the other.

Note, That in all Parallel extents
you muſt ſet the Compaſs points in
that Line only which runs up to the
Center of the head Leg where the
Braſs Pins are put, to ſet the Compaſs
points into, (which you may call the
Common Line.)

4. *Neareſt diſtance,* from a Point to
a Line is only thus, ſet one point of the
Compaſſes in the point given, and open
and ſhut the other, being moved to
and fro till it do juſt touch, or as it
were cleave the Line, that extent I call
the *Neareſt diſtance.*

5. *Any Line being given, and counted
or called any Number of Parts, to add
to it or take from it any parts in Pro-
portion:*   *Example*

one Minute, and every inch one twelfth
part of a Minute.

2. In moderate Draughts, the whole
Scale to 30 may reprefent 3 Models,
then every foot is 6 Minutes, and every
Inch is half a Minute.

3. In fmall Draughts, let every foot
reprefent 1 Model, then every Inch is
5 Minutes, for 12 times 5 is 60, the
Minutes in 1 Model.

Thus the 30 Scales, may conveni-
ently ferve for greater, or leffer Scales,
by opening and fhutting the Lines
Sector-like.

4. The meaning of Four Terms
in the following Ufes, ufed for brevity
fake, viz. Lateral, Parallel, Common
Line, and Nearest distance.

1. Lateral, is any diftance or ex-
tent taken from the Center or be-
ginning of any Line, along the Line
to the part required on one Line only

As the Lateral extent of 10 foot,
the meafure from the Center to 10 foot
on any one of the 30 Scales, or on the

Scale

Scale to 40, or in like manner on the Lines of Chords or Tangents, from the beginning to any Number or Point required.

2. *Parallel* is the extent taken across from one Leg to another, as from 30, on one Leg, to 30 on the other.

Note, That in all Parallel extents you must set the Compass points in that Line only which runs up to the Center of the head Leg where the Brass Pins are put, to set the Compass points into, (which you may call the *Common Line*.)

4. *Nearest distance*, from a Point to a Line *is* only thus, set one point of the Compasses in the point given, and open and shut the other, being moved to and fro till it do just touch, or as it were cleave the Line, that extent I call the *Nearest distance*.

5. *Any Line being given, and counted or called any Number of Parts, to add to it or take from it any parts in Proportion:*

E 3   *Example*

Example, Let 6 inches be called 15 foot, and I would have 12 foot or 20 foot to the same proportion.

Take 6 inches between your Compasses, and make it a Parallel in 15 and 15 on the 30 Scales then the Parallel extent between 12 and 12 on the same 30 Scales, is a shorter Line in proportion, and the Parallel extent from 20 to 20, on the common Line of the same 30 Scales. is a greater Line in Proportion to the first 6 inches called 15 foot.

6. *To divide a Line into any Number of Parts.*

Take the given Line between your Compasses, make it a Parallel in the parts you would have it divided into, on the 30 Scales, then the Parallel extent between 1 and 1, shall divide the Line into the parts required.

Example. Let 5 inches be a Line I would divide into 15 parts, make it a

Paral-

Parallel in 15 and 15 on 30 Scales, then Parallel 1 and 1, shall divide it into 15 parts, or if you make it a Parallel in 30, the double of 15, then take out Parallel 2 and 2, the double of 1, and that shall do better.

7. *Any two Lines given, to find their Proportion one to another in Numbers.*

Take the Lines severally between your Compasses, and lay them latterally from the beginning of any Scale, and the Numbers in which they shall terminate, on the same Scale shall be their Proportion one to another.

But if the name or Number of parts of one Line be resolved on, then thus,

Make that known Line a Parallel in the same like parts on the 30 Scales, then take the other Line between your Compasses, and carry it parallel, till it stay in like parts, on both 30 Scales, and

E 4 that

that shall be the Name to the other Line
in like proportional parts.

Example, Let 5 inches and 7 inches
be two Lines ; let 5 be called 15, then
what is 7 ?

Make 5 inches a parallel in 15 and
15 on the 3c Scales, then 7 inches shall
stay parallelly only in 21 and 21 ; the
Answer.

For by *Gunter's* Line, As 5 to 15,
so is 7 to 21.

8 *To any two Lines given, to find a
Third in continual Proportion (Geome-
trical) either increasing or decreasing.*

Lay both Lines latterally on both
Legs, and note where they end, and
when you increase, take the greatest
lateral Line, and make it a Parallel in
the Terms of the least, then the Paral-
lel Terms of the greatest, gives the
lateral third Terme, in continual Pro-
portion.

But when you would decrease in Pro-
portion,

portion, then fit the lateral leſſer Term in the Parallel greater, then the Parallel Terms from the leaſt, ſhall give a lateral leſſer Term; which by the Line of Numbers is wrought thus: The extent from the firſt term to the ſecond, reaches the ſame way from the ſecond to the third.

Example, The extent from 3 to 5, reaches the ſame way from 5 to 8,333, a third in Proportion *Geometrical*.

9 To divide one line like another, though it be greater or leſſer.

Lay the whole divided Line laterally, and fit the Line to the divided parrallelly in the end thereof: and note the parts to which it extends, (or lay the other common Line to the neereſt diſtance,) then every part of the divided Line laid laterally, and the neareſt diſtance from thence to the Common Line, taken Parallelly, ſhall divide the other Line according to the firſt Line.

E 5   10. To

10. *To find a mean Proportion between two Lines or Numbers.*

Open the 30 Scales to a right Angle, by making lateral 10 foot a parallel in 6 foot and 8 foot, or 21 foot 2 inches a paral. in 15 foot, then of the two Lines or Numbers find the sum, the half sum, difference, and $\frac{1}{2}$ difference, then taking the half sum between your Compasses, and setting 1 point in the half difference, counted on one 30 scale, extend the other point to the other 30 scale on the common Line, and there it shall give the mean proportional Number required.

Example.

If a piece of Timber be 6 inches thick, and 13 inches and $\frac{1}{2}$ broad, what is the Square-equal, which is the Geometrical mean Proportion between 6 and 13 $\frac{1}{2}$, the Sum is 19 $\frac{1}{2}$, the half sum is

is 9 ¾, the difference is 7 ½, the ½ diffe-
rence is 3 ¼.

Take 9 ¾ between your Compasses,
and the 30 Scales set square, put one
point in 3 ¾ on one 30 scale, and the
other Point applied to the common
Line, gives 9 on the other 30 scale for
a Geometrical mean required; for by
Gunter's Line, the Middle between 6
and 13 ½ is 9 the mean.

11 *To work the Rule of Three by the*
30 *Scales.*

As lateral second, to parallel first;
So is parallel third, to lateral fourth.

Example, *If* 5 *foot of wood cost* 4 s.
what cost 23 *foot?*

Make lateral 4 s. a parallel in 5, then
parallel 20 foot, gives lateral 16 s.

12 *To measure Superficial measure.*

1 The inches broad being given, to
find the length of 1 foot.   A 3

As Lateral 12 to Parallel breadth:
So is Parallel 12, to lateral length.

Example, At 8 inches broad, you
shall find 18 inches long makes 1 foot.

2 *The breadth in inches and length
in feet given, to find the Content.*

As Lateral length, to Parallel 12:
So is Parallel breadth, to lateral Content.

Thus at 8 inches broad, and 10 foot
long, you find 7 foot and $\frac{1}{2}$.

13. *To measure Solid measure by
30 Scales.*

1. To find how much long makes 1
foot: As lateral breadth, to parallel 12,
So is parallel depth to lateral fourth.
Again, As lateral 12, to parallel fourth,
so is parallel 12, to lateral length.

Example, at 9 and 14 you find 13
inches $\frac{1}{4}$ in length, to make 1 foot of
Timber.

2. *The*

2. *The sides of the squares and length given, to find the Content in feet.*

As lateral breadth in inches, to parallel 12, so is parallel depth in inches, to lateral fourth.

2 As lateral fourth to parallel 12, so is parallel length in feet to lateral Content.

14. *To divide a Circle into any Parts.*

Make the Semidiameter a Parallel in 6 and 6, (at 15 foot) then the Point required taken Parallelly, shall divide the Circle into the parts required.

Example, Would you have a Circle divided into ten parts?

Make the Semidiameter a Parallel in 6 and 6, the Parallel extent from the points of the small Figures at 10 and 10, shall divide the Circle into 10 parts required : and so for any other.

15. As

15 *At any breadth of a building to find the Rafters and Perpendiculars lenghts, at true pitch, by inspection only.*

Seek for the breadth of the Frame on the 40 Scale, and just against it on the 30 Scale, is the Rafters length required.

Then count the Rafters length on the 40 Scale, and just against it on the 30 Scale, is the Perpendicular Altitude of the Gable end, above the raising piece.

Example, At 24 foot wide, you find 18 foot for the Rafters length, and at 18 foot for Rafter I find 13 foot and 6 inches for Perpendicular.

16 *The half breadth of the Frame, and the Perpendicular height resolved on, to find Rafters, Hips and Sleepers length, and Angles at Foot and Top.*

Open the 30 Scales to a Right Angle by

by 5, 3, and 4, or 10, 8 and 6, or 21 f. 2 inches, and 15 f.

Then count the half width of the Frame on one leg, and the Perpendicular height resolved on, on the other leg, and take that extent between your Compasses, and lay it from the Center, and it shall give the Rafters length required.

Then for the Hips length, the Parallel extent from the half width to the Rafters length, laid latterally from the Center, gives the Hips length.

For the Diagonal Line, count the half width of the Frame on each leg, and the parallel extent between shall be the lateral half Diagonal, or the measure from the corner to the King post; for the Angles, a rule laid to those points on the 30 scales, and a bevel set to that rule and the common line on the 30 scales, give all the Angles required.

Example, Let the frames width be 24 foot, and the perpendicular resolved on 13 foot ½, then the rafters length will.

will be 18 foot, the hips length 21 foot
7 inches and $\frac{1}{4}$, the half Diagonal near
17 foot, the rafters angles at foot 48
gr. 10 m. at foot 41 gr. 50 m. the
hips angles at foot 38, gr. 22 m.
at top 51 gr. 38 m. the outside of the
hip at true pitch 116 gr. $\frac{1}{4}$. The An-
gles being the same in all square frames
at true pitch, but found as above at
any pitch. As for bevel and taper frames
they are more difficult and require a
seheam to make it plain, for the which
I refer you to the Appendix to Scamof-
sy, where it is done at large.

17. *To measure any Angle by the
Chords.*

Apply your rule to any angle of a
building, or set the rule to any angle
you please, then the parallel extent
from 15 to 15, measured laterally on
the line of Chords, gives the angle the
line of 30 scales stand at, the rule being
commonly 2 degrees less; for if you
                                    measure

meafure from the infide to the infide
juft againft 15, it fheweth on the chords
the angle that the rule it felf ftandeth
at.

*On the contrary, to fet the 30 fcales, or
the rule to any angle.*

Take out the lateral chord of the
angle you would have, and make it a
parallel in 15 and 15, or juft againft 15
on the infide, and it fets the lines or
the rule to the angle required.

Ufe XXI.

The *Ufe* of the *Quadrant*
side.

1. TO rectify the rule to 60 degrees,
make the lines on the head
leg, and the hour line on the moving
leg,

leg , to become ftrait and whole.
which otherwife feems broken, and it
is near to 60 degrees.

Or with Compaffes , take any ex-
tent from the rectifying point on the
head leg , to any degree of altitude
on the fame leg , and note it ; then
turn the fame extent , to the common
line on the moving leg , and then re-
move the compafs point from the recti-
fying point , to the common line on
the head leg , and if it hit the firft mea-
fured point , it is exact, elfe not,

Example , Suppofe I take the extent
from the rectifying point on the head ,
(where the hour and azimuth line, and
the line of fines or altitudes meet) to
the center where the thred is faftened ,
and lay the fame extent from the recti-
fying point on the Azimuth line, it
fhall reach to 43 gr. 20 m. of azimuth
(or at leaft to a point, on which the thred
being laid cuts 30 degrees)and the fame
extent laid from that point of 43 gr.
20 m. on the azimuth line, does reach
juft

just to the center again, ard so make
an equal sided triangle ; and the rule
is set to 60 degrees , and fit for obser-
vation.

Or if you have a third piece , with
two tennons at each end ; then put
each tennon in his right mortice hole ,
at the end of the rule , and then the
joynts pulled close , the rule is set to
the exact angle of 60 degrees.

2. *To try if any thing be level, or to
draw a level line.*

On the thred hang a plummet , and
apply the moving leg to the object, and
if the thred cut 60 gr. o m. on the line of
degrees it is level, or else not ; and how
many degrees and minutes out of level,
and which way , the thred on the de-
grees sheweth.

Then on a plain along by the move-
ing leg, you may draw a level line.

3. *T*

5. *To find the Suns rising and setting declination, and the like.*

Open the rule to 60 degrees by (putting in the loose piece) the lines of compasses , then draw the thred in the center strait over the day of the month, then in the line of deg. it sheweth the Suns declination, counting from 60 g. 0 m. to the right hand for north declination or to the left hand for south declination, according to the time of the year, viz. north declination in summer, and south declination in winter , and in the hour line it cuts the suns rising and setting, and his place and right ascension, in the lines of the suns place and right ascension, if you have them on the rule.

Example on the third of April ,

The rule set to 60 degrees, and the thred in the center drawn strait and laid over the third of *April ,* sheweth
9 de

deg. 15 minutes north declination on the right hand of 60 gr. 0 m. also in the hour line, it sheweth 5 gr. 13 m. the time of suns rising, or 6 gr. 47 m. the time of sun setting, according to the progress of the fore-noon or after-noon hours.

And in the lines of the suns place 24 gr. in *Aries*, and in the line of right ascension, 1 hour 28 minutes, and the like for any day in the year.

6. To find the hour of the day.

Rectify the rule by setting it to 60 degrees, then find the suns altitude, by observation, and with compasses take it from the particular scale of altitudes, and lay the thred to the day of the month (or declination of the sun,) then carry the one point of the compasses along in the hour line, till the other foot being turned about, will but just touch the thred at the nearest distance, then the compass point in the hour line, shall shew the hour and minute required.

Exam-

3. *To try if any thing be upright, and to draw a perpendicular line.*

The plummet hanging on the thred, apply the head leg to the wall, or poast to be examined, and if the thred cut the rectifying point or stroke at 90 on the head, when workman like held the plain or poast is upright, and along by the head leg, may you draw out the plain a perpendicular line.

4. *To find an Altitude by the degrees.*

First set the rule to 60 degrees, then a plummet fastened on the end of the thred, look up to the object, by the upper or lower leg, according as the object is high or low, then the thred playing evenly by the moving leg, shall on the degrees shew the angle of Altitude required.

Note, that if the object be low (by your being far from it) then to look along

along by the moving leg is moſt con-
venient , and then you muſt count the
degrees of altitude from 60 gr. 0 m. the
moving leg towards the head , with
10,20,30 at the head.

But if the Altitude be above 30 de-
grees , you muſt look along by the
head leg , and then the figure ſtanding
before the lines being greater than
the other , and numbred from 25,
or 30, to 90 at the head; Note,
that when the Sun ſhines bright ,
the ſhadow of the inſide of the legs
will plainly be ſeen on the head next
the inſide, to ſet the rule exactly, and
the leaning your hand againſt ſome
ſteady thing , will eaſe and help you
to be exact in the doing of this which
is the foundation or baſis of many pro-
poſitions; a heavy plummet is much bet-
ter than a light one , and moves on the
leaſt variation more ſteadily.

5. *To find the Suns rising and setti*
declination, and the like.

Open the rule to 60 degrees by (ma
ing in the loose piece) the line
compasses , then draw the thred in
center strait over the day of the mon
then in the line of deg. it sheweth
Suns declination, counting from 60
o m. to the right hand for north declin
or to the left hand for south declinati
according to the time of the year, i
north declination in summer, and sou
declination in winter, and in the ho
line it cuts the suns rising and settin
and his place and right ascension, in t
lines of the suns place and right ascen
sion, if you have them on the rule.

Example on the third of April ,

The rule set to 60 degrees, and t
thred in the center drawn strait a
laid over the third of *April*, shewe
9 de

deg. 15 minutes north declination on the right hand of 60 gr. 0 m. also in the hour line, it sheweth 5 gr. 13 m. the time of suns rising, or 6 gr. 47 m. the time of sun setting, according to the progress of the fore-noon or after-noon hours.

And in the lines of the suns place 4 gr. in *Aries*, and in the line of right ascension, 1 hour 28 minutes, and the like for any day in the year.

6. To find the hour of the day.

Rectify the rule by setting it to 60 degrees, then find the suns altitude, by observation, and with compasses take it from the particular scale of altitudes, and lay the thred to the day of the month (or declination of the sun,) then carry the one point of the compasses along in the hour line, till the other foot being turned about, will but just touch the thred at the nearest distance, then the compass point in the hour line, shall shew the hour and minute required.   *Exam-*

Example, April 3, *at 20 degr*
high in the fore-noon, you shall find th
hour to be 23 minutes past 7.

But at the same height on the first of
October, you shall find 4 minutes after
9 in the forenoon, or 56 past 2 in the
afternoon, in latitude of 51 gr. 30
being the latitude of *London*.

Note, That the contrary to this, fin
the suns altitude at any hour, at an
time of the year; for if the thred b
laid to the declination, and the neare
distance taken from the hour to th
thred (in the right line) and measure
in the particular scale of altitudes,
gives the suns altitude required at th
hour or minute.

7. *To find the Sun Azimuth.*

Take the Suns declination from th
particular scale between your Com
passes, and lay the thred to the sun
altitu

altitude, counted on the degrees from 60,0 toward the end, and sometimes beyond on the loose piece, and there keep it fixed; then carry the Compasses on the north side in north declinations, and on the south side of the thred in south declinations, that is to say, on the right side of the thred in summer, and on the left side in winter, in the Azimuth line, so as the other point turned about, will but just touch the thred at the nearest distance, then the point fixed in the Azimuth line, shall shew the suns Azimuth from the south required.

Example, At 15 deg. of declination and 20 deg. high, take 15 deg. from the particular scale of altitudes, between your compasses, then the thred laid to 20 deg. counting from 60,0 toward the end so keep it.

Then the neatest distance from the Azimuth line to the thred sheweth 89 deg. the compasses being carried on the right side of the thred, but being set

F

on the left side of the thred , at the
nearest distance in the Azimuth line, it
sheweth 26 deg. from the south, for the
suns Azimuth in the winter at 15 deg.
of declination, and 20 deg. of altitude.

Note, in the equinuctial, when the sun
hath no declination, then there is o to take
between your compasses ; then if you lay
the thred to the suns altitude in the deg.
being counted from 60,0 in the Azimuth
line , it shall shew the Azimuth required.

Example, In latitude 51 deg. 30 m.
at 10 deg. high, the Azimuth is 77 deg.
15 m. from south, at 20 deg. high 61
deg. 45 m. at 30 deg. high , 43 deg.
15 m. at 38 deg. 30 m. high, just south.

8. To draw a *Meridian line.*

On any flat plain, when the sun shin-
eth , draw the line on the plain, made
by the shadow of a thred and plummet
held up , and strait way (or rather at
the same instant let another) take the
suns altitude , and with that find the
sun

suns azimuth, then making a center in
the shadow line, lay off from thence the
right way, the angle of the suns azimuth
found, and draw that line, (the suns
motion, and time of the day consi-
dered, will certainly inform you which
way the south is from the present sha-
dow line) that line I say workman like
performed and drawn, shall be the
true Meridian line required.

9. To find the latitude of a place.

Just at noon, when the sun is in the
meridian, find the suns altitude, and
set it down, and subtract it from 90
to find its complement to 90.

Then in winter subtract the suns pre-
sent declination from the complement of
the suns altitude, and the remainder
is the latitude, but in summer add the
suns co-altitude and declination, and the
sum shall be the latitude.

Example, On *May* the 10th. the
meridian altitude is 58 deg. 37. m.

whose

whose complement to 90 deg. is 31
deg. 23 m. the declination the same day
is 20 deg. 07 m. the sum after addition
is 51 deg. 30. m. the latitude of *London*.

Or again, in winter or south decli-
nation, on *November* the 10th. the
suns declination is 19 deg. 53 m. the
meridian altitude is 18 deg. 37 m. whose
complement is 71 deg. 23 m. from
which taking 19 deg. 53 m. remains
51 deg. 30 m.

There be many other cautions, for
small and great latitudes to be con-
sidered, which I shall not here speak
to, but refer them to the judgment
and reason of the practisioner.

30. To find the hour in other latitudes
the general scale of altitudes, and
line of degrees.

Take the lateral sine of the sum of
the suns present altitude, and his de-
pression at 6 in winter, and make it
paral-

parallel sine in the co-altitude, and lay
the thred to the nearest distance, then
the nearest distance from the secant of
the suns declination, beyond 90 to the
thred, taken parallelly between your
compasses, set one point in 90, and
the thred laid to the nearest distance,
shall shew the hour from 6 in the deg:
counting 15 deg. for an hour.

Example, *The latitude 50 degrees,
the declination 20 degrees south,
the altitude 10 degrees, what is
the hour ?*

Lay the thred to 70 deg. being 20
deg. from the 90 at the head, the suns
declination so counted, then the near-
est distance from the sine of 50 to the
thred, is the suns altitude at 6 in sum-
mer, or his depression in winter, be-
ing in this example 15 deg. 16 m. and
to be laid in summer from the center
downwards, to be substracted from the
suns present altitude, but in winter to

F 3   be

be laid upwards beyond the center, to
be added to the sun's present altitude;
as in this present example reaching to
52½ on the small line of sines beyond
the center; then the lateral extent
from thence to the sine of 10 deg. on
the general scale, being made a par-
rallel in 40, the co-latitude, lay the
thred to the nearest distance, and so
keep it; then take the nearest distance
from the secant of the declination (be-
yond 90 on the head) to the thred, and
make it a parallel sine of 90, and lay
the thred to the nearest distance, and
on the deg. it shall shew the hour and
minute required, viz. 7 m. after 9 in
the fore-noon, or two hours and 5?
m. in the after noon.

But in summer, at the same declina-
tion and altitude of 10 deg. you shall
find the hour to be 5 h. and 27 m. in
the morning, or 6,33 in the after-
noon; 90 at head being alwayes 6, and
0,60 on the loose piece alwayes 12,
which work in short is worded thus.

A

As the latteral sine of the sum of the suns present altitude and altitude at 6. in winter, or difference between the suns present altitude and altitude at 6. in summer, taken onely on sines:

To the parallel co-sine of the latitude, so is the parallel secant of the declination, made a parallel sine of 90, to the hour on the deg. counting from 90, as before in the precept.

More of this, with many other wayes may you find in the Triangular Quadrant, Chap. 15.

11. To find the Suns Azimuth generally.

First, to find the azimuth in the equinoctial, take the tangent of the co-altude from 60,0 on the moving leg toward the end on the degrees; make it a parallel sine of 90, and lay the thred to the nearest distance, and so keep it, by noteing the place where it lyes; then from the same line take the

the tangent of the suns present altitude,
and carry it parallel till it stay in the
sines at the nearest distance to the thred,
and that shall be the sine of the azimuth
required, at that altitude in the equi-
noctial : or thus without tangents,

Take the lateral sine of the suns alti-
tude, make it a parallel in the co-sine
of the latitude, and lay the thred to the
nearest distance, and so keep it ; then
the nearest distance from the sine of the
latitude to the thred, being set in the
co-sine of the suns altitude, and the thred
laid again to the nearest distance, give
the suns azimuth from south as num-
bered, or the azimuth from east or west,
counting on the head :

Example, Latitude 51 deg. 30 m.
Suns altitude 30 deg. the suns azimuth
from south is 43 deg 15 m. or 46 deg.
45 m. from east.

But for all other times, you must first
find the suns altitude at east or west thus:

Take the lateral sine of the suns de-
clination, make it a parallel in the sine
of

of the latitude, and lay the thred to the nearest distance , and on the deg. the the thred gives the altitude at east or west : This altitude at east, you must substract on a line of natural sines. from the sine of the suns present altitude, or take the lesser from the greater, to find a difference with compasses on the general scale : This residue between your compasses, set one foot in the cosine of the latitude, and lay the thred to the nearest distance , then take the nearest distance from the sine of the latitude to the thred , and setting one point in the co-a'titude , and lay the thred to the nearest distance again, and end in the deg. it gives the suns azimuth from south required,

But in winter work thus.

First find the suns amplitude, thus, Take the sine of the suns declination, set one point in the co-latitude , and lay the thred to the nearest distance, and in the degree it gives the suns amplitude required ; which remember : Then

take

take the sine of the suns altitude, and setting one point in the co-sine of the latitude, lay the thred to the nearest distance, and take the nearest distance from the sine of the latitude, to which you must add the sine of the amplitude first found : Then this whole added distance between your compasses, set one point in the co-altitude and lay the the thred to the nearest distance, and on the deg. it gives the azimuth from south, or east or west, as you reckon it; from 0,60 on the loose piece, or 90 at head.

An Example for summer time is this,

The suns declination 13 deg. 15 m. the altitude 37 deg. 27 m. the altitude at east 17. deg. 1 m. the suns azimuth from south will be 60 deg. latitrde 51 deg. 30 m. And at the same declination in winter the Suns amplitude will be found to be 21 deg. 36 m. then at 5 deg 55 m. of Suns altitude, you shall find 60 deg. of azimuth in latitude 51 deg. 30 m.

Use

Use XXII.

The Use of the Almanack.

THE *Almanack* hath usually 10 ranks of figures and letters whose names are exprest on the least ends of those ranks, viz. months in 2 ranks, or 1 large one; days in 5 ranks for 5 times 7 dayes, then the week days, with S. for sunday, and the rest in order: Then a rank of leap years, and lastly a rank of epacts right under, being the epact fit for those leap years, and sometimes the dominical letters, being known by their names on the left end, viz. W. D. for week dayes, L. Y. leap years, D. L. for dominical letters and epacts, whose use is thus.

1. To

1. *To find on what day of the week, the first day of* March *will fall on any year.*

If the year propounded be a leap year, and expressed in the Almanack, then the letter right over for week days sheweth it : *Example* , For the year 1676, exprest there, and the letter right over it is W. for Wednesday. But if it be any other year between a leap year, then thus , seek the leap year last past before the year propounded, and then as before the week day right over is the first of *March*, for that leap year ; then the day changing successively as the week days proceed, as thus : If the first of *March* on a leap year be Monday, the first of *March* the next year following, will be Tuesday, the next Wednesday, the next Thursday, and then the other next succeeding leap year is expressed in the Almanack; thus a right counting from the last leap year answers the question.

Example

Example, Suppose I would know on
what day of the week the first of *March*
shall be in 1677: First in 1676, he Alma-
nack sheweth Wednesday, then in 1677
it will be Thursday, in 1678 Fryday,
in 1679, Saturday, and in 1680, Mon-
day again, as the Almanack sheweth,
and the like for ever.

2. *Having the week day for* March 1
*su any year, to find what day of the week
any day in any month shall be that year.*

In 1677, on *June* 4th, what day of
the week is it, *March* 1 being Thurs-
day? First according to the Old Ro-
man account. *March* is the first month,
then is *June* the 4th. then in the rank
of the months find 4, which is *June* the
4th. month, then all the days right un-
4, in the year 1677, are Thursdays,
viz. the 7th. 14th. 21th. and 28th
days, then if the 7th be Thursday, the
8th is Fryday, the 9th. is Satturday, &c.
So that the 4th. day, the 11th. 18th.
and

and 25th. days of *June*, in 1667 are
Mondays.

To find the Epact any Year, and then
by that to find the Moons Age to a day,

First in every Leap-year for 28 years,
the Epact is expressed right under it,
as right under 1676 is 25, the Epact
that year ; for the other three years be-
tween, add 1, 2, or 3 elevens, and the
sum if under 30 is the Epact required ;
Example, in 1678, what is the Epact ?
In 1676 the Leap-year it is 25, then
1678 being 2 years after, I add 2 e-
levens, *viz.* 22 to 25, the sum is 47,
and being above 30. I take away 30
and the remainder, 17 is the Epact for
1678. Note, that the Dominical or
Sunday Letter, changeth *January* 1, but
the week day and the Epact, on the
first of *March*.

Then to find the Moons Age, add
the Epact, the Month, and the day of
the Month in one sum, and that sum

if

if under 30, is the day of the Moons
Age; so also is the remainder, when
29 or 30 is substracted; substract 30,
when the month hath 31 dayes or but
29, having but 30 days. *Example*,
In 1676, on the 10th. of *May*,
what is the Moons Age? The Epact is
25, the month 3, the day 10, the
sum 38; from which when 30 is sub-
stracted, remains 8, the Moons Age to
a day.

Use XXIII.

*The Use of the General Scale
of Sines in part.*

1. *The sine of an Arch or Angle gi-
ven, find Radius.*

TAke the sine given betwixt your
Compasses, and set one point
in the same sine on the general Scale,
and

and with the other lay the thred to the
nearest distance , and there keep it,
then the nearest distance from 90 to
the Thred is the Radius required to be
found.

2. *Radius, or any known Sine given,
to find any other.*

Take Radius or the sine given, be-
tween your Compasses, and setting one
point in Radius or Sine 90, if that be
given, or in the sine given on the ge-
neral Scale , and with the other point
lay the thred to the nearest distance,
then the nearest distance from any sine
you would have to the thred, shall be
the sine required, or if you have any
unknown sine , carry it nearer or fur-
ther from the center , till the other
point turned about will but just touch
the thred , then the fixed point is the
sine of the measure required to that
Radius.

3. *The*

3. *The Radius being given, to find any Tangent or Secant to the same Radius, by the general Scale of Sines onely.*

Take the given Radius between your Compasses, and set one point in the sine complement of the Tangent required, and lay the Thred to the nearest distance, and so keep it; then the nearest distance from the sine of the Tangent required, shall be the Tangent, and the nearest distance from sine 90, to the Thred, shall always be the Secant required.

4 *Any Tangent or Secant given, to find Radius, and then any other Tangent or Secant required.*

If a Tangent be given, make it a parallel in the sine thereof, and lay the Thred, then the parallel co-sine is Radius.

If

If a Secant be given, make it a parallel always in 90, and lay the Thred (to the nearest distance as always before and after) then the parallel cosine shall be Radius; then having the Radius, make use of the last Rule, to find any thing required.

5. *To lay down any Chord, to any Radius less then the sine 30 on the general Scale.*

Take the given Radius, make it a parallel in 30, and lay the Thred, and being laid, note what deg it cuts, for the more ready setting it again, if you use it often; then the nearest distance from the sine of half the angle required shall be the Chord required.

6. *To lay down any Chord, or Angle to the Radius of the sine 90, on the general Scale.*

Take the whole lateral length, from
th

the Center to 90 on the general Scale,
and lay it down on any line from the
point from whence you would raise the
angle, then take the sine of the angle re-
quired from the Center downward late-
rally, setting one Compass point in the
point made in the end of the line, and
with the other draw the touch of an
arch; then I say a line drawn from the de-
signed Center, to the touch of an arch,
shall be the exact angle required.

Note, If the whole length of the
line be too large, you may use any
less Radius to your mind parallelly; by
fitting the Radius in sine 90, and lay-
ing the thred, then the nearest distance
from the sine required, shall be the
sine to draw the touch of an arch withal.

7. *To lay down readily any Sine,
Tangent, or Secant, to two Radiusses,
viz. The greater on the general Scale,
and moving Leg, the lesser on the loose
piece, and beyond the Center.*

Seek

Seek the fine required on the general
Scale from the Center downward, and
that fhall be the Sine, for the Tan-
gent count from 0,60 on the moving
Leg along the deg. and that extent ta-
ken with Compaffes from the Center
pin at 60,0 fhall be the Tangent
required.

Then for the Secant the extent
from the Tangent to the Center, fhall
be the Secant required.

If the Radius of the general Scale be
too large, then the leffer line of fines
beyond the Center, on the head Leg,
is a line of fines, and the proportional
Tangents is the very deg. on the loofe
piece, counting from 60, toward the
moving Leg, and the Secants, are, the
meafure from the Tangents to the
Center.

Also, *Note*, That the leffer Radius
is juft one third part of the greater, fo
that if the greater Radius proceed not
far enough, then take the fmaller Ra-
dius, and turn the Compaffes 3 times
and

nd you have your want supplied ; but
more ample and plain discourse , will
you find in the Book, called the *Trian-*
gular Quadrant , of these matters.

Use XXIV.

To find the Declination of any plain.

REctify the Triangular Qua-
drant , by putting in the loose
piece ; then the Sun shining at 12 a
Clock , apply the head Leg to the
Wall, holding the Rule as level as you
can ; then hold up a Thred and Plum-
met , till it playing even and steady,
the shadow of the Thred cut the
Center where the Thred is fastened,
and also on the deg. on the head Leg,
or loose piece.

And Note , That that deg. is the de-
clination required , as it is numbred
from

from 0,60 on the loose piece ; for if
the sh.dow fall on the left hand of 0,60
on the loose piece , then the Decli-
nation is Eaſt-ward , if it fall on the
right hand , then the plain declineth
Weſt-ward , ſo many deg. as the ſha-
dow of the Thred ſheweth on the In-
ſtrument.

2. Another time alſo, to come by
the Dec'ination eaſily , is to wait till
the ſhadow of the Thred , held as be-
fore , fall juſt on 0,60 on the looſe
piece , that is when the Sun is juſt a-
gainſt the plain , then, by the Sun a-
titude taken at the ſame time, find the
Suns azimuth , and that ſhall be the
plains true declination required, accor-
ding as the azimuth is, either Eſt-ward
or Weſt-ward, in the fore-noon or af-
ternoon of the day.

3. If either of theſe times are too
particular , or prove inconvenient ,
then thus at any time, except too near
noon ; apply the head Leg to the Wall,
and hold up a Thred and Plummet, and
find

nd what Angle the Shadow makes,
ed on which side of 0,60 on the loose
iece, falling on the left hand past,
nd the right hand want : which set
own in Ink or Chalk, then presently,
s soon as possible, get the Suns altia
de, and set that down also, with the
ay of the month and time of the day,
ither in the fore-noon or after-noon,
in this manner as followeth in the Ex-
mple.

On the 12th. of *May* I come to a
Wall, and applying my Rule, and
olding up a Thred and Plummet, the

	May 12. 1674.	Forenoon.
		gr. m.
Suns Altitude		35 20
Shadow want		40 00
Azimuth want		78 30
South East		38 30

Shadow falls on 40 degrees want, and
at the same time observing the altitude
of

of the Sun, it is 35 deg. 20 m. then the e de
Suns azimuth, at that altitude, will be fame
found to be 78 deg. 30 m. wanting o azim
coming to South, as the shadow wanted 30 n
of coming to the Pole of the plain being
Then always observe to substract the strad
lesser from the greater , the lines being 30 n
alike , viz. both want , or both past cause
and the remainder 38 deg 30 m, is the plain
declination South East , because the of th
Sun would come to the pole or meridian 3 0
of the plain before it comes to the come
South, the meridian of the place. Cloc
Example the second . Suppose that he p
to the same plain, I should in the after
noon apply the Instruments , and the
shadow should fall on 70 deg. pa

May 12, 1674. After-noon.

	gr.	m.
Suns Altitude	56	20
Shadow past	70	00
Azimuth past	31	30
South East	38	30

o de

the deg. 60 m. and the Suns altitude the
ll be same time, 56 deg. 20 m. than the Suns
g o azimuth at that altitude will be 31 deg.
nted 30 m. past the South: here also the signes
lain being alike, *viz.* both past, use Sub-
the straction, and the remainder 38 deg.
eing 30 m. is the declination South East; be-
aste cause it comes to the meridian of the
the plain, before it comes to the meridian
the of the place, *viz.* 12 a Clock.

dia 3. A third Example, Suppose I had
the come to the same plain about 10 a
Clock, and found the Sun to be past
cha the plain 10 deg. and the altitude 37 gr.

May 12, 1674 Fore-noon.

	gr.	m.
Suns Altitude	57	0
Past plain	10	0
Azimuth want	28	30
South East	38	30

hen the azimuth found at that altitude,
will be 28 deg. 30 m. want of South;

G   becaus

because before noon : Here the signes
being unlike, *viz.* one want, the other
past, use addition, and the Sum is
38 deg. 30 m. the declination South
East, because it comes to the meridi-
an of the plain, before it comes to the
meridian of the place South.

4. A fourth Example shall be of a
North West plain, As suppose at 6,
or thereabout, after-noon, I come to
a plain on the same 12th. of *May*,

May 12 1674. After-noon.

	gr.	m.
Suns Altitude	15	0
Shadow want	20	00
Azimuth Sun past	104	20
	124	20
{	180	00
	055	40

674. and applying the Rule to the
Wall, the shadow of the Thred cut
20 deg.

20 deg. wanting of the o deg. 60 m.
and at the same time the Suns altitude
is 15 deg. then the azimuth will be
104 deg. 20 m. past the South ; then
after the addition , because unlike
signes, the Sum is 124 deg. 20 m. whose
complement to 180 , is 55, 40 the de-
clination North West; because the Sun
in the South , cannot look or shine on
such a plain.

One of these four ways , will fit all
Cases can come , but for further con-
firmation , consult the Tryangular
Quadrant.

Note , *That a good Box and Needle ,
will do this work more easily , and be a
good guide in the operation, if it be not
attracted and drawn aside by any mag-
netical property ; yet the way by the Sun
is the certainest and most artificial.*

G 2   Use

Ufe XXV.

To find the Requifites for Erect Decliners, as Subftile, Stile, 12 and 6, and the Inclination of Meridians, for that Latitude the Rule is drawn or made for, viz. 51 deg. 30 m. in the Figure.

1. To find the Subftile from 12.

LAy the Thred to the complement of the declination of the plain, counted on the azimuth line, and on the line of deg. it gives the fub-ftile, counting from 60 deg. 0 m.

Example, Let a plain decline 20 deg. the Thred laid to 70 deg. on the azimuth line, being the complement to 20 deg. fhall cut on the line of deg. 15 deg.

15 deg 12 m. the subftile from 12 degg.
required.

2. *To find the Stiles height above
the Subftile.*

Take the diftance on the azimuth
line, between 90 deg. and the plaines
declination, and meafure it on the par-
ticular fcale of fines, from the begin-
ning, and it fhall reach to the Stiles
height required.

Example, The extent from 90, deg
to 20, gr. on the az muth line, being
laid from 0, on the particular fcale of
fines gives 35 deg. 45 m. the ftiles elevati-
on above the fubftile required.

3. *To find the Angle between 12
and 6.*

Take the plains declination from the
particular Scale of fines (lefs by the
fine of the plains declination, to a Ra-
dius equal to the firft 45 m. of the firft

deg. on the fame particular Sca'e of
fines) and lay it from 90 on the azi-
muth Scale , and to the compass point
lay the thred ; then on the line of deg.
the thred shall give the complement of
6 from 12, counting from 60,0 toward
the loose ipiece, or the Angle it felf
counting 60,0 for 90, 50, for 80, &c.

Example, *For 20 deg. of declination.*

The extent from near 20 m. on the
particular scale , to 20 deg. laid from
90 deg. on the azimuth line , and the
Thred to that point, and drawn streight
on the deg. gives 23 deg. 18 m. or
66 deg. 42 m. the angle of 12 and
6 required.

4. *To find the Inclination of Meri-*
dians.

Count the fubtile on the particular
scale of altitudes , and take the extent
from 0 deg. to the fame between your
compafses , and measure it from 90 on
the

the azimuth line, and it shall give the
complement of the inclination of me-
ridians.

Example, The subsile for 20 deg.
of declination, is 15 deg. 12 m. wh ch
taken from the particular scale of sines,
and measured on the azimuth line from
90 deg. gives 65 deg. 10 m. whose com-
plement 24 deg. 50 m. is the inclina-
tion of meridians required ; for a plain
whose declination is 20 deg.

Thus you may find the requisites for
any declining plain, for that latitude the
the Rule is made for, or by the genera
Scale of Sines, for any latitude in this
manner.

As — *Cotang. lat.*	38	30
To = *Sine 90*	90	00
So = *Sine Declin.*	20	00
To — *Tang. of Substile*	15	12

Substile (left margin label)

G 4   *Stile*

Stile	As — Cosine lat.	38 28	
	To = Sine 90,	90 00	
	So = Cosine Decly.	70 00	
	To — Sine Stile	35 46	
12 and 6.	As — Sine Declin.	20 00	
	To Sine 90,	90 00	
	So = Tang. lat.	51 32	
	To — Cotang. 6 and 12	23 18	
Incli. mers.	As — Tang Declin.	20 00	
	To = Sine lat.	51 32	
	So = Sine 90	90 00	
	To — Tang. In. M.	24 56	

More ways to find these, are set forth
in the Triangular Quadrant.

*The manner of working the last, and
by consequence all the rest, by the gene-
ral Quadrant or Sines, is thus :* •

Take the lateral Tangent of the de-
clination 20 deg. counted from the
Cen-

Center at 60 deg. o m. on the moving
Leg toward the end, between your
Compasses, and make it a parallel sine
of 51 deg. 32 m. in the geueral Scale
of Sines, by putting one point in
51 deg. 32 m. and with the other lay
the Thred to the nearest distance, and
so keep it : Then the parallel sine of
90 taken by putting one point in 90 deg.
and open the other till it will but touch
the Thred at the nearest distance; then
this extent measured laterally, from
60 deg. o m. on the tangent line, will
reach to 24 and 56 the Inclination
of Meridians required; and so for the
rest, as in the Triangular Quadrant.

Use XXVI.

To Draw the Dials.

1. To draw a Horizontal Sun-Dial, Fig. I.

First draw a Meridian line for 12
a Clock, as A B, and in that
line design a point for a Center as at
C, through which point draw a per-
pendicular line for 6 and 6, also
draw two lines at pleasure, parallel and
equidistant from 12, as D E and F G.
Then by *Use* XXIII. *Rule* 3. count
C D Radius, and to it find the Se-
cant of the latitudes complement,
viz. 38,30, thus, Take the extent
C D between your Compasses, and,
setting one point in 51,30, the com-
plement of 38,30, on the general

Scale of Sines, lay the Thred to the neareſt diſtance, then take the neareſt diſtance from 90 to the Thred, and that ſhall be the Secant of 38,30, to lay from D to E, and from F to G, and draw the line E G.

Then make the extent B E, or B G, a parallel in 90, and lay the Thred to the neareſt diſtance, then take the parallel extents, from the points in the general ſcale, being Tangents for the Hours and Quarters, and lay them from B toward E and G, for the Hours and Quarters required. Plainly thus;

Take the extent E B between your Compaſſes, and ſetting one point in 90, with the other lay the Thred to the neareſt diſtance, and there keep the Thred, by noteing what deg. and m. is cut by it, when right laid, then the like parallel extent from the ſeveral hour points, to the Thred at neareſt diſtance, ſhall be the ſeveral Tangents of the Hours and

Quaters

Quarters required : then having
marked the points for 10,11,1, and 2,
from 12 both ways, take the extent
D E, and make that a parallel Tangent
of 3 hours or sine 90 as before, and
lay the Thred to the neerest distance, and
note it, and so keep it till you have taken
all the points severally, and laid them
one after another, on both sides from
D and F, at 6 and 6, for 4,5,7, and 8,
in the morning, and for 4,5,7, and 8 at
the after oon, them, and the quar-
ters between if you please.

Note that the same manner of work-
ing, and the same points, serves for all
erect Decliners, therefore mind this
well, for I intend brevity in the rest
of the Dyals.

The height of the Stile will be 51 gr.
30 minutes, or equal to the Latitude
at all places, for a *Horizontal Dyal*.

2. *To draw a South erect Dyal*, Fig. II.

As in the former Horizontal Dyal,
your

your first line was a Meridian line, so
here in this Dyal (the Plain being sup-
posed fixed) a Perpendicular line, in
the middle of the plain is first to be
drawn for the hour of 12, in which
line design a point for the Center,
and in that Center cross the for-
mer perpendicular line, with a Ho-
rizontal line, for the two 6 a Clock
hour lines, as the two lines A B, and
6 and 6 demonstrate. Also, draw the
lines 6 9 and 6 3, parallel to A B. Then
mark A 6, a parallel sine of 38,30,
the complement of the latitude, and
lay the Thred to the nearest distance,
then take out parallel 90, and lay
it from 6 to 3, and from 6 to 9,
and draw the line 9,3 for the low-
er Co-tangent line; then make 6 A,
a parallel in 90, laying the Thred
and noteing it and take out the hours as
before in the Horizontal, and lay
them both wayes from B for the
noon-hours.

Again, make 6,9 or 6,3 a parallel
sine

sine 90 as before , and lay them, *viz.*
the hour points, from 6 on both sides
downward only , for the morning and
evening hours, for the Stile take pa-
rallel 38,30, from the general Scale,
and setting one point of the Com-
passes in B , with the other make
the touch of an arch, as at C , and
draw the line A C for the Stile line
of the Dyal, 38,30.

3. *To draw an Erect Direct North Dyal* , Fig 111.

As before draw a perpendicular
line, as A B , and a Horizontal line,
as 6,C,6, also draw two lines at plea-
sure equidistant from, and parallel to,
A B , as 4,8 and 8,4 ; then make C
6 , a parallel sine or the co-latitude
38,30, than take out the points for the
hours, and lay them on both sides,
from 6 to 7 and 5, and from 6 to 8 and
4 , upwards and downwards, as in the
Figure for the Stile , make any distance
you

you please, as C A, a parallel fine of 90, then take out parallel 38,28, and make a touch of an arch, as at D, then draw C D for the Stile, which in the North Dyal muft point upward, as it did downwards in the South Dial, and right over the line A C.

4. To Draw an Eaft or Weft Erect Dial.

Rectifie the Rule by putting in the loofe piece, then put a plummet on the Thred, and apply the Rule to the Wall, and caufe the Thred playing well to cut 38,30 the complement of the latitude, then by the head Leg draw the lines A B, C D, parallel one to another, for the two Contingents or Equinoctial lines.

Then in thofe lines defign a point where you intend 6 a Clock fhall be, and in that point crofs the former at right angles, and draw that line for 6 a Clock hour line, then refolve with your felf how far you intend
                                    the

the extent to be from 6 to 11, or
from 6 to 10, what you please; take
the same extent between your Com-
passes, and lay a Rule or Thred to
the Center, at 60 in the loose piece,
and put one point of the Compasses
in 75, on the loose piece; then
put from you, or draw near you,
the Rule, till the other point of the
Compasses will but just touch it, then
there so keep it fixed; then the near-
est distance from 60, on the Tan-
gent on the loose piece, to the edge
of the Rule, shall reach from 6 to 10,
on both the equinoctial lines first
drawn; again the extent from 45 on
the loose piece, to the Rule, shall
reach from 6 to 9; the extent from
30 to the Rule, shall give the mea-
sure from 6 to 4 and 8; lastly the near-
est distance from 15 to the edge of
the Rule (cuting the Center at 0,60)
shall be the extent from 6 to 5 and 7;
then by these points, lines drawn pa-
rallel to 6, or perpendicular to the
equinoctial,

equinoctial , shall be the hour line
required : the Stiles elevation must al-
ways be the space of 3 hours from 6,
viz. the measure from 6 to 9 in the
East Dial , or from 6 to 3 in the
West, and stand right over and pa-
rallel to 6 and the plain.

Note, That the West Dial is like
the East side , when you turn the
backside of the Paper toward you, and
looking against the light , and the
most convenient way to draw the e-
quinoctial line is , to let the plum met
play on 81,30 , and then draw the
line by the loose piece , for an equi-
noctial line , and 6 perpendicular to
it, and all the rest as before. Least I
should be obscure in laying the Rule to
the Center at 60 , mind this Figure
VI, let A B represent the Targent
line on the loose piece , numbred
15,20 45,60,75 at B , then let A C re-
present the edge of a Rule laid over
the Center at **A** , and as far of 75 at
A B, as the intended measure , from
6 to 11 , viz. from B to the arch
D E.   Then

Then the Rule so laid, keep it so,
and the nearest diſtances from 60 45,
30 15, to the edge of the Rule A C
ſhall be the hour ſpaces required, to
lay from 6 on the equinoctial lines.

5. *To draw an Erect Declining Dial*, Fig. VII.

Let the declination of an erect declin-
ing Dial be 20 South Eaſt ; then firſt
by *Uſe* XXV. find the requiſite
as ſubſtile , ſtile , 6 and 12 , and the
inclination of Meridians , and ſet
them down in a Paper in this manner,
or how elſe you think fit.

Subſtile	15	12
Stile	35	45
12 and 6	66	42
Incli. Meri.	24	50

Then firſt draw a perpendicular
line for 12, as A B , and then two
lines on each ſide , equidiſtant and
parallel

parallel to 12 , as C D and E F; then appoint a place for a Center, as at A, and from thence design any distance, as to B, and take it between the Compasses , and make it a parallel sine of 90 , and lay the Thred , and note the place or so keep it; then take out the parallel sine of 15, 12, and setting one foot in B, describe the touch of an arcke, as at G, and draw A G for the Substile Westwards ; then make A G equal to A B, and the Thred laid as before , take out the parallel sine of 35,45 , and setting one point in G, draw the touch of an arch, as at H, and draw A H for the Stile , then take out the parallel sine of 66,42 , and draw the touch of an arch, as at I, one point being fixed in B, and draw that line for 6 ; or you may lay these angles off in an arch, as with Chords by *Use* XXIII. *Rule* 5.

Then take the distance of the parallel A C, and by *Use* XIII. *Rule* 4. make it a parallel sine 90 , then take

out

out the parallel sine of 70, the comple-
ment of declination , and make thit
a parallel sie of 38 28 , and then
take out paral'el 90 , and lay it from
A to K , and on the paral'el from
6 to D or 9 , then make K D a pa-
rallel sine 90 , and lay off the hour
points both ways from K , for 10, 11,
1 and 2 , and if you take the Tan-
gent of Inclinations from 60, 0 , and
lay it on the general Scale downward,
and then take from thence to the Thred
it will reach from K to G, the sub-
stile, if you have made no mistake in
your former work.

Lastly , Make 6 D a parallel sine
of 90 , and lay off the hour points
from 6 , as you did before , and
you have points to draw the hour
lines withal ; if you want a point
at 4 after noon , the measure from
9 to 8 on the East side, is equal to
the measure from 3 to 4 , and so for
all others, as 5 or 6.

---

6. T.

6. *To draw a North West Erect De-
ciner, declining* 30 *deg.* Fig. VIII.

First , As before by Use X X V.
and the requisites and set them down
ready for your use.

Substile	21	40	
Stile	32	35	*North West* 30 d.
12 and 6	57	49	
Incli. Mer.	36	25	

Then draw a perpendicular line,
representing 12 at midnight , as A B ,
and a parallel thereto, as C D, on both
sides , if you please as before , then
being a North plain , the Stile look-
ing upwards , the Center is downward,
as at E.

Also Note in this , And all other
plains the Substile is laid contrary to
the coast of declination , lay off, as is
taught before , the Substile, Stile 12
and 6.

Then

T.

Then mak: A C a Secant of 30
and take out the Secant of 51,30
and make it a parallel fine of 90, an
lay down the hour points as before
and draw the hour lines that be pro
per for fuch a declining Dial, to w
thofe that can come in ufe at an
time of the year.

7. To draw a far Declining Dial
Fig. I X.

Thofe Dials that decline above 4
or 50 deg. ought to have their Stile
augmented, or elfe they will no
be comely nor convenient, which
augmenting may be done fever
ways, but this by the Sector I con
clude moft neat and ready in opera-
tion.

As for *Example* in a South-eaft
decliner 80 deg.

Firft, as before, find the requifites
and fet them down; then by help of
the inclination of Meridians, make a

Table

Table of hour arkes at the pole , by
...ling the inclination of Meridans al-
...ways 12 ; subtract
for... deg for an Hour,
pro...30 for half an
...w...our, and 3 deg.
an...m. for a quar-
ter, as often as you
...an, setting down
Dial the remainder as
...ere you see.

Then when you
...an take no more,
...tile...e the remain-
...no...from 7,30, and
...hich...down what
...era...mains, and then
...on...dd 7,30 till
...era...ou have enough
...s in the Table
...east...nexed.

Then first draw
...tes...perpendicular
...of...ne on the North
...e...dge of the plain as A B, and from

Subtile	38	02
Stile	06	12
6 and 12	38	53
Inc. Meri.	82	08
	74	38
11	67	08
	59	38
10	52	08
	44	38
9	37	08
	29	38
8	22	08
	14	38
7	07	08
	00	22
6	07	52
	15	22
5	22	52
	30	22
4	37	52
	45	22

B

B lay off 38,2, for the Substile, be
done by Tangents or sines by C H 2,2,
then draw that line A C, and crossi
with two lines square to it, as D E
F G ; in the upper line design a place
for 11, and 3½ as E and D, then tak
45,22, the number in the Table, fo
3½ out of the Tangents on the loose
piece, and add it to the Tangent of
67,8, for 11, and the Sum on the sam
Tangent line is 73,35, then take th
extent D E, and setting one point in
73,35, lay a Rule over the Cente
at 60,0 on the loose piece, and th
nearest distance as in the East Dial
then take out the parallel Tangent o
45,22, and lay it from D, and the
parallel Tangent of 67,8, and lay i
from E, and they meet in H, the
place of the Substile, then draw H F
parallel to A C for the Substile, and
then lay off all the numbers in the
Table, for the hours and halfs, as the
Rule lies in its first position, and mar
them with small figures to know them
again,

sg in , and be sure to draw the touch
of an arch with the Tangent of 45
deg. for the Stiles height, as H K.

Then make H I a parallel Tangent
of 45 , and take out the Tangent of
6, 12 for the Stiles height, and lay it from
I to L , then take out H K the first Ra-
dius , and lay it from L to M in the
touch of an arch , then draw K M by
the convexity of the two arches, for
the Stile line ; then make I M a paral-
lel Tangent of 45 , by laying a Rule
to 60, 0 on the loose piece and 45 , by
the extent I M , then from I lay off all
the numbers in the Table again , and
mark them as before on this other con-
tingent line G F, as in the figure.

Then lines drawn to those marks ,
shall be the hour lines for a South-east
declining 80 deg. the Stile must be ac-
cording to the pattern in the figure, *viz.*
the line N O set right , and so far o-
ver H , as the distance in the Dial ex-
presseth.

If this seem too brief, you have it
H   **more**

more plainly and copiously in the *Triangular Quadrant*, to which I refer you, for the making all sorts of Dials, and for any Latitude and the Ornaments also.

Use XXVIII.

To find Altitudes, or Distances by the Quadrant and Shadows, and first for Accessable, at one Station by the Shadows.

1 SEt the Rule to an Angle of 60 deg. by putting in the loose piece, and hang a plummet on the Thred; and looking up to the mark at E, Suppose the plummet line fall on 1, or go nearer or further till it fall on 1, on the line of shadows then conclude that the altitude of the
Obje

Object at E , is just as high above the level of the eye, as from C to A, *viz.* the place of standing, to right under the Object at A.

Also if you go so far off the Object that the line falls on 2 of contrary shadows, *viz.* at 26, 34 , the Object is but half the length of the distance A D , but if you approach so near as that the Thred shall fall on 2 of right shadow, at 63, 26, the height is double the distance , as A B is twice A B; but to find the height at any observation by the line of Numbers, say, always for right shadow, that is, when the Thred falls between 1 at 45 and 90 , As 1 to the parts cut by the Thred , so is the measured distance to the height required; but for contray shadow , that is when the Thred falls between 0, 60 on the loose piece, and 45, then say, As the parts cut by the Thred are to 1, so is the measured distance to the height.

<center>H 2</center> <div align="right">*Example.*</div>

Examp'e , The extent from 1 to
2 , the parts cut by the Thred at B,
shall reach the same way on the line
of Numbers from 15 , the measured
parts B A to 30 , the height re-
quired.

Again , The extent from 2 , the
parts cut at D to 1, shall reach the same
way from 60 , the parts measured,
to 30 the height as before,

The same Rules serves at any odd
parts whatsoever, and the same man-
ner of work serveth ; if you measure
the shadow of any Tree or other Ob-
ject, and observe what part of the
line of shadows the Thred falleth on,
in taking the Suns Altitude.

2. *For an Unaccessable Altitude at
two Stations by the Line of Sha-
dows.*

First, Observe at B , and note the
parts cut, *viz.* 2 , secondly, observe
at C , and note the parts cut suppose

1, or any other odd parts, but to
observe more exactly, use the deg.
which are close divided, and set
down both the Angles, *viz.* the An-
gle observed and his complement,
counting one as figured, and the
complement (*viz.* the angle at the
top) count from the head; as here
in this Observation, the observed An-
gle is at C 45, so likewise is the
complement 45, counting from the
head also.

The other Angle observed at B is
63,26; his complement counting from
the head is 26,34, the Angle at D
is 26,34, but his complement at E
is 63,26, and the same Rule for all
right Angle Triangles as these are.

Then observe the difference in
Tangents between the two Angles
at the top found thus, the comple-
ment at the Angle at B, *viz.* A E B
is 26,34, the Thred laid to 26,34
on the Quadrat, gives 50; again, the
Thred laid to 45 on the Quadrat,

H 3   gives

gives 100 ; then 50 taken from 100,
the difference is 50.

Then the Rule is by the line of
Numbers onely.

The extent from 50 the (laſt found)
difference to 100 , ſhall reach from
15 the meaſured diſtance between B
and C , to 30 the height.

Again, in the other Stations, viz.
at C and D, the Angle at the Top
is at C 45 , the Angle at D at the
Top is 63,26, viz. the complement
of the Angle at D ; then the Thred
laid to 45 , on the Quadrat, gives
100 , the Thred laid to 63,26, on
the line of ſhadows , gives 200 ,
Subſtraction made remains 100 , for
the difference in Tangents.

Then as before, the extent from
100 to 100 , ſhall reach from 30
the meaſured diſtance to 30 the
height ; and the like for any odd num.
whatſoever.

Or elſe without the difference in
Tangents by ſines and lines , ſub-
ſtract

ſtract the complement of the Angle
at C , from the complement of the
Angle at D . *viz.* 45 from 63,26 ,
and the diff.rence is 18,26 ; then
ſay,

As lateral 30 , taken from any
Scale of equal parts, as inches, foot
meaſure, or lines , is to the parallel
ſine of 18,26 , the oppoſite angle,
laying the Thred to the neareſt di-
ſtance , ſo is the parallel ſine of 26,34,
to 42.45, the ſide C E.

Again, Secondly , As lateral 42,45 ,
to parallel ſine 90 , ſo is the paral-
lel ſine of 45 to 30 the altitude re-
quired.

The like work at two operations
ſerves any right line Triangle, but
much more of this kind in the *Tri-
angular Quadrant.*

Note, That one good way to come
by an altitude at two ſtations, is to
go too and fro , till the Angle at
the fartheſt ſtation be half the An-
gle at the neareſt , as the Angle

B is double the Angle at E, and
the measured side B F, is equal to
B E; then as 90 to B E, so is 63,26
to A F 30.

3. *To take the measure of a long
Distance*, Fig X I.

Let A be the station to stand at,
and E the mark a far off, whose di-
stance is to be measured.

Set the Instrument, *viz.* the Tri-
angular Rule, on some flat steady
place at A, , and look exactly to E
then turn the index about in a per-
pendicular line to A E, toward B,
and measure in that line any num-
ber of yards or feet, as suppose 70,
and there leave a mark at B, there
also get the Angle A B E, and by
consequence the Angle B E A, the
complement thereof.

Then measure from A towards E
any certain number of yards, as sup-
pose 100, and then from thence go
toward

toward D , in a strait perpendicular
line to A E , till you espy E and B
in a right line ; then measure also
this distance C D , as suppose 58 ,
then are you furnished two ways to
get the distance C E or A C , as fol-
loweth.

1. First , by the line of numbers
onely.

As the difference between A B
and C D 12 , is to the distance be-
tween A and C 100 , so is the mea-
sured distance A B 70 , to the di-
stance required A E 55 ; so also
is C D 58 to C E 485.

2. Secondly , To work the same by
sines and lines.

As lateral 70 , from any small
Scale, to the parallel sine of 6 gr.
48 m. so is the parallel sine of 83,12 ,
to the lateral length 585 , on the
H 5   same

same Scale you took 70 from; and
so is the parallel sine of 90, to E B
590.

Note, That you ought to mea-
sure A B very exactly, and take the angle
A B E exactly also, or else your work
will never agree, in the two several
ways of working.

4. *To find any Breadth or Distance
by Scale and Compass or Calcu-
lation*, Fig. XII.

Let A B be two marks, as the
two corners of a Wall, and let the
measure A B be demanded, and their
distance from C and D, the two
stations.

First, Set up a mark at one sta-
tion, and measure any certain mea-
sure as you please, and which way
you find most convenient, as at C
and D 100 foot between.

Set up the Rule on his staff right
over C, and set the lines and sines
directly

directly to D , the other mark, and
there fix it then direct the fight
exactly to B , and note the Angle
that you find, as here 45 deg. then
direct the fights to A , and note
that Angle from D 113. deg.

Secondly , remove the instrument
to D , and set the fines and lines
exactly to C, then fix it there, and
then observe the Angles C D A 42,30,
and C D B 109.

Then the Three Angles of every
Triangle being equal to 180 deg.
the sum of 42,30 and 113 , *viz.*
155,30, taken from 180 remains 24 30,
the Angle D A C, likewise the sum of
45 and 109, *viz.* 154 taken from 180
rests 26, the Angle C B D.

Then by these observations , you
may with Scale and Compass on Pa-
per, or flate , draw the figure thus,
as annexed.

Draw the line C D, and from your
Scale lay down 100 parts, from C to
D , then with a line of Chords as

the azimuth line, the general and
particular Scale of sines are, making
the sine 30 Radius, as by Use 23
Rule 5.

And lay off the Angles as observed, and draw the lines as in the
Figure, then you may measure every
side and distance, as you please, by
the same Scale you took C D from.

As for the Calculation, it is best
performed by the Tables of Sines and
Tangents, or a *Gunters Rule* is more
ready than the natural lines, and
for ample directions therein, consult the *Triangular Quadrant* and
Doctrines of Plain Triangles.

Use

Use XXIX.

To find the Hour of the Day and Suns Azimuth in any other Latitude by the general Scale of Sines.

That the Rule may be general for more places than one, I have added this Use.

THerefore first to find the Latitude of any place, do thus, Just at noon on any day, find the Suns Altitude as carefully and exactly as you may, which to do the more certainly, observe the Altitude a little before noon, and set it down in

in a Paper or a Book, and then continue so observing every minute, or as often as you can, still setting every Observation down, till you are sure it is past noon, then the comparing of them together, will confirm you which is the best or truest Observation, and the greatest and certainest of them you may conclude to be the Suns Meridian Altitude for that day: To which Meridian Altitude in Winter or Southern Declinations, add the Suns Declination, and the Sum is the complement of the Latitude.

But in Summer time or Northern Declinations, substract the Declination out of the Suns Meridian Altitude, and the remainder is the complement of the Latitude required.

Example, suppose on the 10th of *April* the Noon Altitude of the Sun is 50 deg. 13 m. the Declination of the Sun the same day is 11 deg. 45 m. Northward, then 11 deg. 45 m. taken
ken

ken from 50 deg. 13 m. rests 38 deg. 28 m. the complement of the Latitude at *London*.

Again , Suppose on the 20th of *February* the Suns Declination is 70 deg. 3 m. South , and his Meridian Altitude the same day 31 deg. 25 m. the sum of them added together makes 31 deg. 28 m. the complement of the Latitude , which taken from 90 deg. rests 51 deg. 32 m. the Latitude of *London* required. This Rule serves from 23 deg. 30 m. to 66 deg. 30 m. North Latitude.

1. *Then the Latitude, Suns Declination, and Altitude being given, to find the Hour of the Day.*

In the Equinoctial , when the declination is 0 , take the lateral sine of the Suns Altitude from the general Scale , and make it a parallel in the co-sine of the Latitude , and with the other point lay the Thred to the

nearest

nearest distance , and on the deg. it gives the hour required, counting 90 at the head , 6 and 60,0, on the loose piece 12.

Example , At 20 deg of Altitude in 51 deg. 30 m. Latitude, you find 8 hours 12 m. in the morning or 3 hours 48 m. in the afternoon.

2. To find the Hour at any other time of the year.

Count the Suns Declination on the deg. from 90 at the head toward the loose piece, and there lay the Thred.

Then the nearest distance from the sine of the Latitude, counted on the general Scale, to the Thred, shall be the sine of the Suns Altitude at 6, which distance in Summer lay from the Center downward, and in Winter from the Center (where the Thred is fastened) upward , and note that place for all that day.

Then

Then take from that noted pl ce to
the fine of the Suns Altitude on the
general Scale, with this distance set
one foot in the co fine of the Latitude, and lay the Thred to the near.
est distance and so keep it.

Then take the nearest distance from
the fine of 90 to the Thred, then
with this distance set one foot in the
co-fine of the Suns declination, and
with the other lay the Thred to the
nearest distance, and in the deg. it
cuts the hour required.

Example, Suppose on the 5th
of *April* or on the 12th of *February*, when the Suns Declination is
10 deg. and the Suns Altitude on
each day 15 deg. what is the hour?

The Thred laid to 10 on the deg.
counting from the head, and the
nearest distance from 51 deg. 30 m.
to the Thred, gives the fine of 7 deg.
45 m, the Suns height at 6 in *April*,
or his depression at 6 in *February*.
This distance laid downward reaches
to

to 7 deg. 45 m. on the large gene the th
ral scale, for the 5th. of *April*, o mpl
being laid upward reaches to near 2 and u
on the small sines, for the 12th. of F stance
bruary.   in th

There the extent from 7 deg. 45 the t
the noted point to 15, the Suns prese *Febru*
altitude, taken between the Compa
ses, set one point in 38 deg. 30 m th W
latitudes complement, and with th the
other lay the Thred to the neare the
distance; lastly, take the nearest d tra
stance from 90 to the Thred, and se pr
ting one point in 10 deg. counting op
from 90, (or the sine of 80, the com
plement of 10) and lay the Thred to
the nearest distance; and on the deg
it gives 46 m. after 6 in the morning
or 14 m. after 5 at night, on the 5th
of *April*. But on the 12th. of *Fe-
bruary* the laterat extent from the up-
per mark (near 24 deg. on the small
sines) to 15, laid from 38, 30, and the
thred laid to the nearest distance:
Lastly, the nearest extent from 90 to
                                        the

the thred, laid from the fine of 80 the complement of the Suns declination, and the thred laid to the nearest distance again, gives 8 and 40 min. in the morning, or 3 and 20 m. in the after-noon, for the 12th day of *February*.

Which work is only an adding of the Suns depression at 16 in Winter to the Suns present altitude; or the subtracting the Suns height at 6 from the present altitude in Summer, for the first operation.

3. *The Suns altitude and declination and latitude given, to find the Suns Azimuth generally.*

Take the fine of the Suns declination from the general Scale, set one foot in the fine of the latitude, on the same Scale, and with the other lay the thred to the nearest distance, and on the degrees it gives the Suns altitude at

E st or West , count this on the gene   4.
ral Sca'e , and take from thence to th   *d*
S ns present altitude , which work   *pl*
makes a substraction of the lesser from
the greater.

With this remaining distance set on   *inatio*
f ot in the co-sine of the latitude , and   *e o*
lay the thred to the nearest distance   *id t*
then take the nearest distance from th   *ees*
sine of the latitude to the thred : fi   *u*
this again in the co-altitude , and th   Th
thed laid to the nearest distance , give   *s*
the Suns azimuth from South requi   *ike*
red.

Example , In latitude 51 deg. 30   *en*
min , the declination 7 deg. North, th   *f th*
Suns Vertical altitude at East will b   *dd*
8 deg. 57 min. and the present altitude   *p*
being 30, the residue or difference wil   *ou*
be the sine of 20 deg. 13 min. and the   *i*
Suns azimuth found thereby will be 60   *i*
deg. 12 min. from the South.

4. *But*

4. *But in Winter time or Southern declinations, first find the Suns amplitude thus :*

Take the lateral sine of the Suns declination, make it a parallel in the co-sine of the latitude ; then the thred laid to the nearest distance in the degrees, gives the Suns amplitude ; which you must remember.

Then take the lateral sine of the Suns present altitude, and make it a parallel in the co-sine of the latitude, and lay the thred to the nearest distance, then the nearest distance from the sine of the latitude to the thred , is to be added laterally to the sine of the suns amplitude, and that sum taken between our Compasses ; make it a parallel sine in the co-sine of the suns present altitude ; and the thred laid to the nearest distance on the degrees , gives the suns present azimuth from the south required.

Example,

Example, At 15 degrees of decli-
nation and 15 degrees of altitude, the
amplitude is 24 deg 40 min. and the
azimuth from fouth 39 and 30; but
from Eaft or Weft 50, 30.

*Much more variety of this
kind may you find in the Trian-
gular Quadrant, chap.* 15.
